3.4	Validate command	18

1 The trident CLI

Trident is a command line software tool structured in multiple subcommands. If you installed it properly you can call it on the command line by typing `trident`. This will show an overview of the general options and all subcommands, which are explained in detail below.

```
Usage: trident [--version] [--logMode MODE | --debug] [--errLength INT]
           [--inPlinkPopName MODE] (COMMAND | COMMAND)
```

trident is a management and analysis tool for Poseidon packages. Report issues

34 here: <https://github.com/poseidon-framework/poseidon-hs/issues>

35
36 Available options:

37	<code>-h, --help</code>	Show this help text
38	<code>--version</code>	Show version number
39	<code>--logMode MODE</code>	How information should be reported: NoLog, SimpleLog, DefaultLog, ServerLog or VerboseLog.
40		(default: DefaultLog)
41		
42	<code>--debug</code>	Short for --logMode VerboseLog.
43	<code>--errLength INT</code>	After how many characters should a potential error message be truncated. "Inf" for no truncation.
44		(default: CharCount 1500)
45		
46	<code>--inPlinkPopName MODE</code>	Where to read the population/group name from the FAM file in Plink-format. Three options are possible: asFamily (default) asPhenotype asBoth.
47		
48		
49		

50 Package creation and manipulation commands:

51	<code>init</code>	Create a new Poseidon package from genotype data
52	<code>fetch</code>	Download data from a remote Poseidon repository
53	<code>forge</code>	Select packages, groups or individuals and create a new Poseidon package from them
54		
55	<code>genoconvert</code>	Convert the genotype data in a Poseidon package to a different file format
56		
57	<code>rectify</code>	Adjust POSEIDON.yml files automatically to package changes
58		
59		

60 Inspection commands:

61	<code>list</code>	List packages, groups or individuals from local or remote Poseidon repositories
62		
63	<code>summarise</code>	Get an overview over the content of one or multiple Poseidon packages
64		
65	<code>survey</code>	Survey the degree of context information completeness for Poseidon packages
66		
67	<code>validate</code>	Check Poseidon packages or package components for structural correctness
68		

69 Trident allows to work directly with genotype data (see `-p` below), but its optimized for the interaction
70 with [Poseidon packages](#), which wrap and contextualize the data. Most trident subcommands therefore have a
71 central parameter, called `--baseDir` or simply `-d` to specify one or more base directories to look for packages.
72 For example, if all Poseidon packages live inside a repository at `/path/to/poseidon/packages` you would
73 simply say `trident <subcommand> -d /path/to/poseidon/dirs/` and `trident` would automatically search
74 all subdirectories inside of the repository for valid Poseidon packages (as identified by valid `POSEIDON.yml`
75 files).

76 You can arrange a poseidon repository in a hierarchical way. For example:

77 `/path/to/poseidon/packages`

```

78     /modern
79         /2019_poseidon_package1
80         /2019_poseidon_package2
81     /ancient
82         /...
83         /...
84     /Reference_Genomes
85         /...
86         /...

```

87 You can use this structure to select only the level of packages you're interested in, even individual ones, and you
88 can make use of the fact that `-d` can be given multiple times.

89 Being able to specify one or multiple repositories is often not enough, as you may have your own data to
90 co-analyse with the main repository. This is easy to do, as you simply need to provide your own genotype data
91 as yet another Poseidon package to be added to your `trident` command. For example, let's say you have
92 genotype data in `EIGENSTRAT` format (`trident` supports `EIGENSTRAT` and `PLINK` as formats.):

```

93 ~/my_project/my_project.geno
94 ~/my_project/my_project.snp
95 ~/my_project/my_project.ind

```

96 then you can make that to a skeleton Poseidon package with the `init` command. You can also do it manually
97 by simply adding a `POSEIDON.yml` file, with for example the following content:

```

98 poseidonVersion: 2.7.1
99 title: My_awesome_project
100 description: Unpublished genetic data from my awesome project
101 contributor:
102   - name: Stephan Schiffels
103     email: schiffels@institute.org
104 packageVersion: 0.1.0
105 lastModified: 2020-10-07
106 genotypeData:
107   format: EIGENSTRAT
108   genoFile: my_project.geno
109   snpFile: my_project.snp
110   indFile: my_project.ind
111   jannoFile: my_project.janno
112   bibFile: sources.bib

```

113 Two remarks: 1) all file paths are considered *relative* to the directory in which `POSEIDON.yml` resides. For this
114 example we assume that this file is added into the same directory as the three genotype files. 2) Besides the
115 genotype data files there are two (technically optional) files referenced by this example `POSEIDON.yml` file:
116 `sources.bib` and `my_project.janno`. Of course you can add them manually - `init` automatically creates
117 empty dummy versions.

118 Once you have set up your own Poseidon package (which is really only a skeleton so far), you can add it to your
119 `trident` analysis, by simply adding your project directory to the command using `-d`, for example:

```

120 trident list -d /path/to/poseidon/packages/modern \
121     -d /path/to/poseidon/packages/ReferenceGenomes
122     -d ~/my_project --packages

```

123 1.1 General notes

124 1.1.1 Logging and command line output

125 For all subcommands the general argument `--logMode` defines how trident reports messages (to stderr) on the
 126 command line:

- 127 • *NoLog*: Hides all messages.
- 128 • *SimpleLog*: Plain and simple output to stderr.
- 129 • *DefaultLog*: Adds severity indicators before each message. (default setting)
- 130 • *ServerLog*: Additionally adds timestamps before each message.
- 131 • *VerboseLog*: Shows not just messages on the log levels `Info`, `Warning` and `Error` like the other modes,
 132 but also on the more verbose level `Debug`. Use this for debugging.

133 `--debug` is short for `--logMode VerboseLog` to activate this important log level more easily.

134 1.1.2 Duplicates

- 135 • If multiple packages in a package repository share the same `title`, then trident will try to select the
 136 one with the highest version number. If this is not sufficient to resolve the conflict, trident will stop. An
 137 exception for that is the `list` subcommand, which will read and report all packages/groups/individuals
 138 in all versions.
- 139 • Individual/sample names (`Poseidon_ID` s) within one package have to be unique, or trident will stop.
- 140 • We generally also discourage ID duplicates across packages in package repositories, but trident will generally
 141 continue with them after printing a warning. This does not apply for `validate`, by default (you can
 142 change this behaviour with `--ignoreDuplicates`), and `forge`. `forge` offers a special mechanism to
 143 resolve duplicates within its selection language (see below).

144 1.1.3 Group names in .fam files

145 The `.fam` file of Plink-formatted genotype data is used inconsistently across different popular aDNA software
 146 tools to store group/population name information. The (global) option `--inPlinkPopName` with the arguments
 147 `asFamily` (default), `asPhenotype` and `asBoth` allows to control the reading of the population name from
 148 Plink `.fam` files. The subcommands that write genotype data (`forge`, `genoconvert`) have a corresponding
 149 option `--outPlinkPopName` to specify this for the output.

150 1.1.4 Whitespaces in the .janno file

151 While reading the `.janno` file `trident` trims all leading and trailing whitespaces around individual cells. Also
 152 all instances of the `No-Break Space` unicode character will be removed. This means these whitespaces will not
 153 be preserved when a package is `forge` d.

2 Package creation and manipulation commands

2.1 Init command

`init` creates a new, valid Poseidon package from genotype data files. It adds a valid `POSEIDON.yml` file, a dummy `.janno` file for context information and an empty `.bib` file for literature references.

[Click here for command line details](#)

```
Usage: trident init ((-p|--genoOne FILE) | --inFormat FORMAT --genoFile FILE
                --snpFile FILE --indFile FILE) [--snpSet SET]
                (-o|--outPackagePath DIR) [-n|--outPackageName STRING]
                [--minimal]
```

Create a new Poseidon package from genotype data

Available options:

<code>-h,--help</code>	Show this help text
<code>-p,--genoOne FILE</code>	One of the input genotype data files. Expects <code>.bed</code> , <code>.bim</code> or <code>.fam</code> for PLINK and <code>.geno</code> , <code>.snp</code> or <code>.ind</code> for EIGENSTRAT. The other files must be in the same directory and must have the same base name.
<code>--inFormat FORMAT</code>	The format of the input genotype data: EIGENSTRAT or PLINK. Only necessary for data input with <code>--genoFile</code> + <code>--snpFile</code> + <code>--indFile</code> .
<code>--genoFile FILE</code>	Path to the input geno file.
<code>--snpFile FILE</code>	Path to the input snp file.
<code>--indFile FILE</code>	Path to the input ind file.
<code>--snpSet SET</code>	The snpSet of the package: 1240K, HumanOrigins or Other. Only relevant for data input with <code>-p --genoOne</code> or <code>--genoFile</code> + <code>--snpFile</code> + <code>--indFile</code> , because the packages in a <code>-d --baseDir</code> already have this information in their respective <code>POSEIDON.yml</code> files. (default: Other)
<code>-o,--outPackagePath DIR</code>	Path to the output package directory.
<code>-n,--outPackageName STRING</code>	The output package name. This is optional: If no name is provided, then the package name defaults to the basename of the (mandatory) <code>--outPackagePath</code> argument. (default: Nothing)
<code>--minimal</code>	Should the output data be reduced to a necessary minimum and omit empty scaffolding?

The command

```
trident init \
  --inFormat EIGENSTRAT/PLINK \
  --genoFile path/to/geno_file \
```

```

196 --snpFile path/to/snp_file \
197 --indFile path/to/ind_file \
198 --snpSet 1240K|HumanOrigins|Other \
199 -o path/to/new_package_name

```

200 requires the format (`--inFormat`) of your input data (either `EIGENSTRAT` or `PLINK`), the paths to the
 201 respective files (`--genoFile` , `--snpFile` , `--indFile`), and optionally the “shape” of these files (`--snpSet`),
 202 so if they cover the `1240K`, the `HumanOrigins` or an `Other` SNP set. A simpler interface is available with
 203 `-p (+ --snpSet)` .

	EIGENSTRAT	PLINK
genoFile	.geno	.bed
snpFile	.snp	.bim
indFile	.ind	.fam

204 The output package of `init` is created as a new directory `-o` , which should not already exist, and gets the
 205 package `title` corresponding to the basename of `-o` . You can also set the title explicitly with `-n` . The
 206 `--minimal` flag causes `init` to create a minimal package with a very basic `POSEIDON.yml` and no `.bib` and
 207 `.janno` files.

208 2.2 Fetch command

209 `fetch` allows to download Poseidon packages from a remote Poseidon server via a [Web API](#). Read more about
 210 the data available with it [here](#).

211 [Click here for command line details](#)

```

212 Usage: trident fetch (-d|--baseDir DIR)
213             (--downloadAll |
214             (--fetchFile FILE | (-f|--fetchString DSL)))
215             [--remoteURL URL] [--archive STRING]

```

217 Download data from a remote Poseidon repository

219 Available options:

220 <code>-h,--help</code>	Show this help text
221 <code>-d,--baseDir DIR</code>	A base directory to search for Poseidon packages.
222 <code>--downloadAll</code>	Download all packages the server is offering.
223 <code>--fetchFile FILE</code>	A file with a list of packages. Works just as <code>-f</code> , but
224	multiple values can also be separated by newline, not
225	just by comma. <code>-f</code> and <code>--fetchFile</code> can be combined.
226 <code>-f,--fetchString DSL</code>	List of packages to be downloaded from the remote
227	server. Package names should be wrapped in asterisks:
228	<code>*package_title*</code> . You can combine multiple values with
229	comma, so for example: <code>"*package_1*, *package_2*,</code>
230	<code>*package_3*"</code> . <code>fetchString</code> uses the same parser as
231	<code>forgeString</code> , but does not allow excludes. If groups

```

232         or individuals are specified, then packages which
233         include these groups or individuals are included in
234         the download.
235     --remoteURL URL          URL of the remote Poseidon server.
236                             (default: "https://server.poseidon-adna.org")
237     --archive STRING         The name of the Poseidon package archive that should
238                             be queried. If not given, then the query falls back
239                             to the default archive of the server selected with
240                             --remoteURL. See the archive documentation at
241                             https://www.poseidon-adna.org/#/archive_overview for
242                             a list of archives currently available from the
243                             official Poseidon Web API. (default: Nothing)

```

244 It works with

```

245 trident fetch -d ... -d ... \
246     -f "*package_title_1*,*package_title_2*,*package_title_3*,group_name,<individual1>"

```

247 and the entities you want to download must be listed either in a simple string of comma-separated values, which
248 can be passed via `-f / --fetchString`, or in a text file (`--fetchFile`). Entities are then combined from
249 these sources.

250 Entities are specified using a special syntax (see also the documentation of `forge` below): Package titles are
251 wrapped in asterisks: `*package_title*`, group names are spelled as is, and individual names are wrapped in
252 angular brackets, so `<individual1>`. Fetch will figure out which packages need to be downloaded to include
253 all specified entities. `--downloadAll`, which can be given instead of `-f` and `--fetchFile`, causes fetch to
254 download all packages from the server. The downloaded packages are added in the first (!) `-d` directory (which
255 gets created if it doesn't exist), but downloads are only performed if the respective packages are not already
256 present in the latest version in any of the `-d` dirs.

257 Note that `trident fetch` makes most sense in combination with `trident list --remote`: First one can
258 inspect what is available on the server, then one can create a custom fetch command.

259 `fetch` also has the optional arguments `--remote https://...` to name an alternative Poseidon server
260 and `--archive` to select a Poseidon archive on the server. Here is a list of the [archives available on the official](#)
261 [Poseidon server](#).

262 2.3 Forge command

263 `forge` creates new Poseidon packages by extracting and merging packages, populations and individuals from
264 your Poseidon repositories.

265 [Click here for command line details](#)

```

266 Usage: trident forge ((-d|--baseDir DIR) |
267                     ((-p|--genoOne FILE) | --inFormat FORMAT --genoFile FILE
268                     --snpFile FILE --indFile FILE) [--snpSet SET])
269                     [--forgeFile FILE | (-f|--forgeString DSL)]
270                     [--selectSnps FILE] [--intersect] [--outFormat FORMAT]
271                     [--minimal] [--onlyGeno] (-o|--outPackagePath DIR)
272                     [-n|--outPackageName STRING] [--packagewise]

```

```

273                                     [--outPlinkPopName MODE]
274
275 Select packages, groups or individuals and create a new Poseidon package from
276 them
277
278 Available options:
279   -h,--help                Show this help text
280   -d,--baseDir DIR         A base directory to search for Poseidon packages.
281   -p,--genoOne FILE        One of the input genotype data files. Expects .bed,
282                             .bim or .fam for PLINK and .geno, .snp or .ind for
283                             EIGENSTRAT. The other files must be in the same
284                             directory and must have the same base name.
285   --inFormat FORMAT        The format of the input genotype data: EIGENSTRAT or
286                             PLINK. Only necessary for data input with --genoFile
287                             + --snpFile + --indFile.
288   --genoFile FILE          Path to the input geno file.
289   --snpFile FILE           Path to the input snp file.
290   --indFile FILE           Path to the input ind file.
291   --snpSet SET             The snpSet of the package: 1240K, HumanOrigins or
292                             Other. Only relevant for data input with -p|--genoOne
293                             or --genoFile + --snpFile + --indFile, because the
294                             packages in a -d|--baseDir already have this
295                             information in their respective POSEIDON.yml files.
296                             (default: Other)
297   --forgeFile FILE         A file with a list of packages, groups or individual
298                             samples. Works just as -f, but multiple values can
299                             also be separated by newline, not just by comma.
300                             Empty lines are ignored and comments start with "#",
301                             so everything after "#" is ignored in one line.
302                             Multiple instances of -f and --forgeFile can be
303                             given. They will be evaluated according to their
304                             input order on the command line.
305   -f,--forgeString DSL     List of packages, groups or individual samples to be
306                             combined in the output package. Packages follow the
307                             syntax *package_title*, populations/groups are simply
308                             group_id and individuals <individual_id>. You can
309                             combine multiple values with comma, so for example:
310                             "*package_1*, <individual_1>, <individual_2>,
311                             group_1". Duplicates are treated as one entry.
312                             Negative selection is possible by prepending "-" to
313                             the entity you want to exclude (e.g. "*package_1*,
314                             -<individual_1>, -group_1"). forge will apply
315                             excludes and includes in order. If the first entity
316                             is negative, then forge will assume you want to merge
317                             all individuals in the packages found in the baseDirs

```

(except the ones explicitly excluded) before the exclude entities are applied. An empty forgeString (and no --forgeFile) will therefore merge all available individuals. If there are individuals in your input packages with equal individual id, but different main group or source package, they can be specified with the special syntax "<package:group:individual>".

--selectSnps FILE To extract specific SNPs during this forge operation, provide a Snp file. Can be either Eigenstrat (file ending must be '.snp') or Plink (file ending must be '.bim'). When this option is set, the output package will have exactly the SNPs listed in this file. Any SNP not listed in the file will be excluded. If option '--intersect' is also set, only the SNPs overlapping between the SNP file and the forged packages are output. (default: Nothing)

--intersect Whether to output the intersection of the genotype files to be forged. The default (if this option is not set) is to output the union of all SNPs, with genotypes defined as missing in those packages which do not have a SNP that is present in another package. With this option set, the forged dataset will typically have fewer SNPs, but less missingness.

--outFormat FORMAT The format of the output genotype data: EIGENSTRAT or PLINK. (default: PLINK)

--minimal Should the output data be reduced to a necessary minimum and omit empty scaffolding?

--onlyGeno Should only the resulting genotype data be returned? This means the output will not be a Poseidon package.

-o,--outPackagePath DIR Path to the output package directory.

-n,--outPackageName STRING The output package name. This is optional: If no name is provided, then the package name defaults to the basename of the (mandatory) --outPackagePath argument. (default: Nothing)

--packagewise Skip the within-package selection step in forge. This will result in outputting all individuals in the relevant packages, and hence a superset of the requested individuals/groups. It may result in better performance in cases where one wants to forge entire packages or almost entire packages. Details: Forge conceptually performs two types of selection: First, it identifies which packages in the supplied base directories are relevant to the requested forge, i.e.

```

363         whether they are either explicitly listed using
364         *PackageName*, or because they contain selected
365         individuals or groups. Second, within each relevant
366         package, individuals which are not requested are
367         removed. This option skips only the second step, but
368         still performs the first.
369     --outPlinkPopName MODE Where to write the population/group name into the FAM
370                           file in Plink-format. Three options are possible:
371                           asFamily (default) | asPhenotype | asBoth. See also
372                           --inPlinkPopName.
373
374     forge can be used with
375
376     trident forge -d ... -d ... \
377         -f "*package_name*, group_id, <individual_id>" \
378         -o path/to/new_package_name
379
380     where the entities (packages, groups/populations, individuals/samples) you want in the output package can be
381     denoted either as a string on the command line ( -f / --forgeString ), or in an input text file ( --forgeFile ).
382     See the section below for the syntax of this selection language. Do not forget to wrap the --forgeString query
383     in quotes.
384
385     Including one or multiple Poseidon packages with -d is not the only way to include data for a forge
386     operation. It is also possible to consider unpackaged genotype data directly with -p (+ --snpSet) or
387     --inFormat + --genoFile + --snpFile + --indFile (+ --snpSet). This makes the following example
388     possible, where we merge data from one Poseidon package and two genotype datasets to get a new EIGENSTRAT
389     dataset.
390
391     trident forge \
392         -d 2017_GonzalesFortesCurrentBiology \
393         -p 2018_VeeramahPNAS/2018_VeeramahPNAS.fam \
394         --inFormat PLINK \
395         --genoFile 2017_HaberAJHG/2017_HaberAJHG.bed \
396         --snpFile 2017_HaberAJHG/2017_HaberAJHG.bim \
397         --indFile 2017_HaberAJHG/2017_HaberAJHG.fam \
398         -f "<STR241.SG>,<ERS1790729.SG>,Iberia_HG.SG" \
399         -o testpackage \
400         --outFormat EIGENSTRAT \
401         --onlyGeno

```

397 2.3.1 The forge selection language

398 The text in **--forgeString** and **--forgeFile** are parsed as a domain specific query language that describes
399 precisely which entities should be compiled in the output package of a given **forge** operation. The language
400 has multiple syntactic elements and a specific evaluation logic.

401 In general a **--forgeString** query consists of multiple entities, separated by **,**. The main entities are Poseidon
402 packages, groups/populations and individuals/samples:

- 403 • Each package title is surrounded by *** : *package***. That means if you want all individuals of the Poseidon

package `2019_Jeong_InnerEurasia` in the output package you would add `*2019_Jeong_InnerEurasia*` to the query.

- Groups/populations are not specially marked: `group`. So to get all individuals of the group `Swiss_Roman_period`, you would simply add `Swiss_Roman_period`.
- Individuals/samples are surrounded by `<` and `>`: `<individual>`. `ALA026` therefore becomes `<ALA026>`. A second way to denote individuals is with the more verbose and specific syntax `<package:group:individual>`. Such defined individuals take precedence over differently defined ones (so: directly with `<individual>` or as a subset of `*package*` or `group`). This allows to resolve duplication issues precisely – at least in cases where the duplicated individuals differ in source package or primary group.

In the `--forgeFile` each line is treated as a separate `forgeString`, empty lines are ignored and `#`s start comments. So this is a valid `forgeFile`:

```
# Packages
*package1*, *package2*

# Groups and individuals from other packages beyond package1 and package2
group1, <individual1>, group2, <individual2>, <individual3>

# group2 has two outlier individuals that should be ignored
-<bad_individual1> # This one has very low coverage
-<bad_individual2> # This one is from a different time period
```

By prepending `-` to the bad individuals, we can exclude them from the forged package. `forge` figures out the final list of samples to include by executing all `forge`-entities in order. So an entity list `*PackageA*,-<Individual1>,GroupA` may result in a different outcome than `*PackageA*,GroupA,-<Individual1>`, depending on whether `<Individual1>` belongs to `GroupA` or not. If the `forge` entity list starts with a negative entity, or if the entity list is empty, `forge` will implicitly assume you want to include all individuals in all packages found in the `baseDirs` (except the ones explicitly excluded, of course).

An empty `forgeString` will therefore merge all available individuals.

2.3.2 Treatment of the .janno file while merging

`forge` merges and subsets `.janno` files along with the genotype data. If a package lacks a `.janno` file, then a basic one will be created internally based on the information in the genotype data, and used for the output. Missing columns across packages will be filled with `n/a`.

For merging two `.janno` files **A** and **B** the following rules apply regarding undefined, arbitrary additional columns:

- If **A** has an additional column which is not in **B** then empty cells in the rows imported from **B** are filled with `n/a`.
- If **A** and **B** share additional columns with identical column name, then they are treated as semantically identical units and merged accordingly.
- In the resulting `.janno` file, all additional columns from both **A** and **B** are sorted alphabetically and appended after the normal, specified variables.

The following example illustrates the described behaviour:

A.janno

Poseidon_ID	Group_Name	Genetic_Sex	AdditionalColumn1	AdditionalColumn2
XXX011	POP1	M	A	D
XXX012	POP2	F	B	E
XXX013	POP1	M	C	F

B.janno

Poseidon_ID	Group_Name	Genetic_Sex	AdditionalColumn3	AdditionalColumn2
YYY022	POP5	F	G	J
YYY023	POP5	F	H	K
YYY024	POP5	M	I	L

A.janno + B.janno

Poseidon_ID	Group_Name	Genetic_Sex	AdditionalColumn1	AdditionalColumn2	AdditionalColumn3
XXX011	POP1	M	A	D	n/a
XXX012	POP2	F	B	E	n/a
XXX013	POP1	M	C	F	n/a
YYY022	POP5	F	n/a	J	G
YYY023	POP5	F	n/a	K	H
YYY024	POP5	M	n/a	L	I

2.3.3 Treatment of the .ssf file while merging

The Sequencing Source File (short .ssf file) is forged in exactly the same way as the janno file. SSF files that are present are included in the forge product in the way that the user expects, following selection of those entities which are listed in the `poseidon_IDs` columns of the SSF files. Columns that are only present in some packages, including those not defined by our [Schema] are also included in the forged product in the same way as described for Janno above.

2.3.4 Treatment of the .bib file while merging

In the forge process all relevant samples for the output package are determined. This includes their .janno entries and therefore the information on the publication keys documented for them in the .janno `Publication` column. The output .bib file compiles only the relevant references for the samples in the output package. It includes the references exactly once and is sorted alphabetically (by key).

2.3.5 Other options

Just as for `init` the output package of `forge` is created as a new directory `-o`. The title can also be explicitly defined with `-n`.

`--minimal` allows for the creation of a minimal output package without `.bib` and `.janno`. This is especially useful for data analysis pipelines, where only the genotype data is required. Even more basic output comes with `--onlyGeno`, which means that only the genotype data is returned without any Poseidon package.

`forge` has a an optional flag `--intersect`, that defines, if the genotype data from different packages should be merged with an **union** or an **intersect** operation. The default (if this option is not set) is to output the union of all SNPs, with genotypes defined as missing in samples from packages which do not have a SNP that is present in another package. With this option set, on the other hand, the forged dataset will typically have fewer SNPs, but less missingness.

`--intersect` also influences the automatic determination of the `snpSet` field in the POSEIDON.yml file for the resulting package. If the `snpSet` s of all input packages are identical, then the resulting package will just inherit this configuration. Otherwise `forge` applies the following pairwise merging logic:

Input snpSet A	Input snpSet B	<code>--intersect</code>	Ouput snpSet
Other	*	*	Other
1240K	HumanOrigins	True	HumanOrigins
1240K	HumanOrigins	False	1240K

`--selectSnps` allows to provide `forge` with a SNP file in EIGENSTRAT (`.snp`) or PLINK (`.bim`) format to create a package with a specific selection. When this option is set, the output package will have exactly the SNPs listed in this file. Any SNP not listed in the file will be excluded. If `--intersect` is also set, only the SNPs overlapping between the SNP file and the forged packages are output.

Merging genotype data across different data sources and file formats is tricky. `forge` is more verbose about potential issues, if the `--logMode` flag is set to `VerboseLog`.

The `--onlyGeno` command specifies that only genotype data should be output, not an entire Poseidon package.

With `--packagewise` the within-package selection step in forge can be skipped. This will result in outputting all individuals in the relevant packages, and hence a superset of the requested individuals/groups. It may result in better performance in cases where one wants to forge entire packages.

2.4 Genoconvert command

`genoconvert` converts the genotype data in a Poseidon package to a different file format. The respective entries in the POSEIDON.yml file are changed accordingly.

[Click here for command line details](#)

```
Usage: trident genoconvert ((-d|--baseDir DIR) |
    ((-p|--genoOne FILE) | --inFormat FORMAT
    --genoFile FILE --snpFile FILE --indFile FILE)
    [--snpSet SET]) --outFormat FORMAT [--onlyGeno]
    [-o|--outPackagePath DIR] [--removeOld]
    [--outPlinkPopName MODE]
```

Convert the genotype data in a Poseidon package to a different file format

Available options:

<code>-h,--help</code>	Show this help text
<code>-d,--baseDir DIR</code>	A base directory to search for Poseidon packages.
<code>-p,--genoOne FILE</code>	One of the input genotype data files. Expects .bed,

```

499         .bim or .fam for PLINK and .geno, .snp or .ind for
500         EIGENSTRAT. The other files must be in the same
501         directory and must have the same base name.
502     --inFormat FORMAT      The format of the input genotype data: EIGENSTRAT or
503                             PLINK. Only necessary for data input with --genoFile
504                             + --snpFile + --indFile.
505     --genoFile FILE        Path to the input geno file.
506     --snpFile FILE         Path to the input snp file.
507     --indFile FILE         Path to the input ind file.
508     --snpSet SET           The snpSet of the package: 1240K, HumanOrigins or
509                             Other. Only relevant for data input with -p|--genoOne
510                             or --genoFile + --snpFile + --indFile, because the
511                             packages in a -d|--baseDir already have this
512                             information in their respective POSEIDON.yml files.
513                             (default: Other)
514     --outFormat FORMAT     the format of the output genotype data: EIGENSTRAT or
515                             PLINK.
516     --onlyGeno             Should only the resulting genotype data be returned?
517                             This means the output will not be a Poseidon package.
518     -o,--outPackagePath DIR Path to the output package directory. This is
519                             optional: If no path is provided, then the output is
520                             written to the directories where the input genotype
521                             data file (.bed/.geno) is stored. (default: Nothing)
522     --removeOld            Remove the old genotype files when creating the new
523                             ones.
524     --outPlinkPopName MODE Where to write the population/group name into the FAM
525                             file in Plink-format. Three options are possible:
526                             asFamily (default) | asPhenotype | asBoth. See also
527                             --inPlinkPopName.
528
529     With the default setting
530
531     trident genoconvert -d ... -d ... --outFormat EIGENSTRAT|PLINK
532
533     all packages in -d will be converted to the desired --outFormat (either EIGENSTRAT or PLINK ), if the data
534     is not already in this format. This includes updating the respective POSEIDON.yml files.
535
536     The “old” data is not deleted, but kept around. That means conversion can result in a package with both PLINK
537     and EIGENSTRAT data, but only one is linked in the POSEIDON.yml file, and that is what will be used by
538     trident. To delete the old data in the conversion you can add the --removeOld flag.
539
540     Instead of -d to change Poseidon packages, the -p (+ --snpSet) or --inFormat + --genoFile + --snpFile + --indFi
541     allow to directly convert genotype data that is not wrapped in a Poseidon package and store it to a directory
542     given in -o . See this example:
543
544     trident genoconvert \
545         -p 2018_Mittnik_Baltic/Mittnik_Baltic.bed \
546         --outFormat EIGENSTRAT
547         -o my_directory

```

2.5 Rectify command

rectify automatically harmonizes POSEIDON.yml files of one or multiple packages. This is not an automatic update from one Poseidon version to the next, but rather a clean-up wizard after manual modifications.

Click here for command line details

```
Usage: trident rectify (-d|--baseDir DIR) [--ignorePoseidonVersion]
      [--poseidonVersion ??.?]
      [--packageVersion VPART [--logText STRING]]
      [--checksumAll | [--checksumGeno] [--checksumJanno]
      [--checksumSSF] [--checksumBib]]
      [--newContributors DSL]
```

Adjust POSEIDON.yml files automatically to package changes

Available options:

-h,--help	Show this help text
-d,--baseDir DIR	A base directory to search for Poseidon packages.
--ignorePoseidonVersion	Read packages even if their poseidonVersion is not compatible with trident.
--poseidonVersion ??.?	Poseidon version the packages should be updated to: e.g. "2.5.3".
--packageVersion VPART	Part of the package version number in the POSEIDON.yml file that should be updated: Major, Minor or Patch (see https://semver.org).
--logText STRING	Log text for this version in the CHANGELOG file.
--checksumAll	Update all checksums.
--checksumGeno	Update genotype data checksums.
--checksumJanno	Update .janno file checksum.
--checksumSSF	Update .ssf file checksum
--checksumBib	Update .bib file checksum.
--newContributors DSL	Contributors to add to the POSEIDON.yml file in the form "[Firstname Lastname](Email address);..."

It can be called with a lot of optional arguments:

```
trident rectify -d ... -d ... \
  --poseidonVersion "X.X.X" \
  --packageVersion Major|Minor|Patch \
  --logText "short description of the update"
  --checksumAll
  --newContributors "[Firstname Lastname](Email address);..."
```

These arguments determine which fields of the POSEIDON.yml file should be modified.

- **--poseidonVersion** allows a simple change of the **poseidonVersion** field in the POSEIDON.yml file.
- **--packageVersion** increments the package version number in the first, the second or the third position. It can optionally be called with **--logText**, which appends an entry to the CHANGELOG file for the

584 respective package version update. `--logText` also creates a new CHANGELOG file if it does not exist
 585 yet.

- 586 • `--checksumGeno`, `--checksumJanno`, `--checksumSSF` and `--checksumBib` add or modify the respec-
 587 tive checksum fields in the POSEIDON.yml file. `--checksumAll` is a wrapper to call all of them at
 588 once.
- 589 • `--newContributors` adds new contributors.

590 :warning: As `rectify` reads and rewrites POSEIDON.yml files, it may change their inner order, layout or
 591 even content (e.g. if they have fields which are not in the [POSEIDON.yml definition](#)). Create a backup of the
 592 POSEIDON.yml file before running `rectify` if you are uncertain if this might affect you negatively.

593 3 Inspection commands

594 3.1 List command

595 `list` lists packages, groups and individuals of the datasets you use, or of the packages available on the server.

596 [Click here for command line details](#)

```
597 Usage: trident list ((-d|--baseDir DIR) | --remote [--remoteURL URL]
598                   [--archive STRING])
599                   (--packages | --groups | --individuals
600                   [-j|--jannoColumn COLNAME]) [--raw]
```

602 List packages, groups or individuals from local or remote Poseidon
 603 repositories

605 Available options:

606 -h,--help	Show this help text
607 -d,--baseDir DIR	A base directory to search for Poseidon packages.
608 --remote	List packages from a remote server instead the local 609 file system.
610 --remoteURL URL	URL of the remote Poseidon server. 611 (default: "https://server.poseidon-adna.org")
612 --archive STRING	The name of the Poseidon package archive that should 613 be queried. If not given, then the query falls back 614 to the default archive of the server selected with 615 --remoteURL. See the archive documentation at 616 https://www.poseidon-adna.org/#/archive_overview for 617 a list of archives currently available from the 618 official Poseidon Web API. (default: Nothing)
619 --packages	List all packages.
620 --groups	List all groups, ignoring any group names after the 621 first as specified in the .janno-file.
622 --individuals	List all individuals/samples.
623 -j,--jannoColumn COLNAME	List additional fields from the janno files, using 624 the .janno column heading name, such as "Country",

625 "Site", "Date_C14_Uncal_BP", etc..

626 `--raw` Return the output table as tab-separated values

627 without header. This is useful for piping into `grep`

628 or `awk`.

629 To list packages from your local repositories, as seen above you can run

630 `trident list -d ... -d ... --packages`

631 This will yield a nicely formatted table of all packages, their version and the number of individuals in them.

632 You can use `--remote` to show packages on the remote server. For example

633 `trident list --packages --remote --archive "community-archive"`

634 will result in a view of all packages available in one of the [public online archives](#). Just as for `fetch`, the

635 `--archive` flag allows to choose which public archive to query.

636 Independent of whether you query a local or an online archive, you can not just list packages, but also groups,

637 as defined in the third column of EIGENSTRAT `.ind` files (or the first/last column of a PLINK `.fam` file),

638 and individuals with the flags `--groups` and `--individuals` (instead of `--packages`).

639 The `--individuals` flag additionally provides a way to immediately access information from `.janno`

640 files on the command line. This works with the `-j/--jannoColumn` option. For example adding

641 `-j Country -j Date_C14_Uncal_BP` to the commands above will add the `Country` and the `Date_C14_Uncal_BP`

642 columns to the respective output tables.

643 Note that if you want a less fancy table, for example because you want to load this into Excel, or pipe into

644 another command that cannot deal with the table layout, you can use the `--raw` option to output that table as

645 a simple tab-delimited stream.

646 3.2 Summarise command

647 `summarise` prints some general summary statistics for a given poseidon dataset taken from the `.janno` files.

648 [Click here for command line details](#)

649 Usage: `trident summarise (-d|--baseDir DIR) [--raw]`

650

651 Get an overview over the content of one or multiple Poseidon packages

652

653 Available options:

654 <code>-h,--help</code>	Show this help text
655 <code>-d,--baseDir DIR</code>	A base directory to search for Poseidon packages.
656 <code>--raw</code>	Return the output table as tab-separated values
657	without header. This is useful for piping into <code>grep</code>
658	or <code>awk</code> .

659 You can run it with

660 `trident summarise -d ... -d ...`

661 which will show you context information like – among others – the number of individuals in the dataset, their

662 sex distribution, the mean age of the samples (for ancient data) or the mean coverage on the 1240K SNP array

663 in a table. `summarise` depends on complete .janno files and will silently ignore missing information.

664 You can use the `--raw` option to output the summary table in a simple, tab-delimited layout.

665 3.3 Survey command

666 `survey` tries to indicate package completeness (mostly focused on `.janno` files) for poseidon datasets.

667 [Click here for command line details](#)

668 Usage: trident survey (-d|--baseDir DIR) [--raw]

669

670 Survey the degree of context information completeness for Poseidon packages

671

672 Available options:

673	<code>-h,--help</code>	Show this help text
674	<code>-d,--baseDir DIR</code>	A base directory to search for Poseidon packages.
675	<code>--raw</code>	Return the output table as tab-separated values
676		without header. This is useful for piping into grep
677		or awk.

678 Running

679 `trident survey -d ... -d ...`

680 will yield a table with one row for each package. See `trident survey -h` for a legend which cell of this table
681 means what.

682 Again you can use the `--raw` option to output the survey table in a tab-delimited format.

683 3.4 Validate command

684 `validate` checks Poseidon packages and individual package components for structural correctness.

685 [Click here for command line details](#)

686 Usage: trident validate ((-d|--baseDir DIR) [--ignoreGeno] [--fullGeno]

687 [--ignoreDuplicates] [-c|--ignoreChecksums]
688 [--ignorePoseidonVersion] |
689 --pyml FILE | (-p|--genoOne FILE) | --inFormat FORMAT
690 --genoFile FILE --snpFile FILE --indFile FILE |
691 --janno FILE | --ssf FILE | --bib FILE) [--noExitCode]

692

693 Check Poseidon packages or package components for structural correctness

694

695 Available options:

696	<code>-h,--help</code>	Show this help text
697	<code>-d,--baseDir DIR</code>	A base directory to search for Poseidon packages.
698	<code>--ignoreGeno</code>	Ignore snp and geno file.
699	<code>--fullGeno</code>	Test parsing of all SNPs (by default only the first
700		100 SNPs are probed).
701	<code>--ignoreDuplicates</code>	Do not stop on duplicated individual names in the

```

702 package collection.
703 -c,--ignoreChecksums Whether to ignore checksums. Useful for speedup in
704 debugging.
705 --ignorePoseidonVersion Read packages even if their poseidonVersion is not
706 compatible with trident.
707 --pym1 FILE Path to a POSEIDON.yml file.
708 -p,--genoOne FILE One of the input genotype data files. Expects .bed,
709 .bim or .fam for PLINK and .geno, .sn1 or .ind for
710 EIGENSTRAT. The other files must be in the same
711 directory and must have the same base name.
712 --inFormat FORMAT The format of the input genotype data: EIGENSTRAT or
713 PLINK. Only necessary for data input with --genoFile
714 + --sn1File + --indFile.
715 --genoFile FILE Path to the input geno file.
716 --sn1File FILE Path to the input sn1 file.
717 --indFile FILE Path to the input ind file.
718 --janno FILE Path to a .janno file.
719 --ssf FILE Path to a .ssf file.
720 --bib FILE Path to a .bib file.
721 --noExitCode Do not produce an explicit exit code.

```

722 You can run it with

```
723 trident validate -d ... -d ...
```

724 to check packages and it will either report a success (`Validation passed`) or failure with specific error messages.

725 Instead of validating entire packages with `-d` you can also apply it to individual files and package components:
726 `--pym1` (POSEIDON.yml), `-p | --inFormat + --genoFile + --sn1File + --indFile` (genotype data),
727 `--janno` (.janno file), `--ssf` (.ssf file) or `--bib` (.bib file). In this case `validate` attempts to read and
728 parse the respective files individually and reports any issues it encounters. Note that this considers the files in
729 isolation and does not include any cross-file consistency checks.

730 When applied to packages, `validate` tries to ensure that each package adheres to the `schema definition`. Here
731 is a list of what is checked:

- 732 • Structural correctness of the POSEIDON.yml file.
- 733 • Presence of all files references in the POSEIDON.yml file.
- 734 • Full structural correctness of .janno, .ssf and .bib file.
- 735 • Superficial correctness of genotype data files by parsing the first 100 SNPs. A full check that parses all SNPs
736 can be triggered with the `--fullGeno` option. `--ignoreGeno`, on the other hand, causes `validate` to
737 ignore the genotype data entirely, which speeds up the validation significantly.
- 738 • Correspondence of BibTeX keys in .bib and .janno
- 739 • Correspondence of sample IDs in .janno and .ssf.
- 740 • Correspondence of sample and group IDs in .janno and genotype data files.

741 In fact much of this validation already runs as part of the general package reading pipeline invoked for other
742 trident subcommands (e.g. `forge`). `validate` is meant to be more thorough/brittle, though, and will explicitly
743 fail if even a single package is broken. For special cases more flexibility can be enabled with the options
744 `--ignoreDuplicates`, `--ignoreChecksums` and `--ignorePoseidonVersion`.

745 Remember to run `validate` it with `--debug` to get more information in case the default output is not sufficient
746 to analyse an issue.
