3.3	Survey command	19
3.4	Validate command	19

1 The trident CLI

Trident is a command line software tool structured in multiple subcommands. If you installed it properly you can call it on the command line by typing `trident`. This will show an overview of the general options and all subcommands, which are explained in detail below.

```
Usage: trident [--version] [--logMode MODE | --debug] [--errLength INT]
           [--inPlinkPopName MODE] (COMMAND | COMMAND)
```

34 trident is a management and analysis tool for Poseidon packages. Report issues
 35 here: <https://github.com/poseidon-framework/poseidon-hs/issues>
 36

37 Available options:

38	<code>-h,--help</code>	Show this help text
39	<code>--version</code>	Show version number
40	<code>--logMode MODE</code>	How information should be reported: NoLog, SimpleLog,
41		DefaultLog, ServerLog or VerboseLog.
42		(default: DefaultLog)
43	<code>--debug</code>	Short for --logMode VerboseLog.
44	<code>--errLength INT</code>	After how many characters should a potential error
45		message be truncated. "Inf" for no truncation.
46		(default: CharCount 1500)
47	<code>--inPlinkPopName MODE</code>	Where to read the population/group name from the FAM
48		file in Plink-format. Three options are possible:
49		asFamily (default) asPhenotype asBoth.
50		

51 Package creation and manipulation commands:

52	<code>init</code>	Create a new Poseidon package from genotype data
53	<code>fetch</code>	Download data from a remote Poseidon repository
54	<code>forge</code>	Select packages, groups or individuals and create a
55		new Poseidon package from them
56	<code>genoconvert</code>	Convert the genotype data in a Poseidon package to a
57		different file format
58	<code>rectify</code>	Adjust POSEIDON.yml files automatically to package
59		changes
60		

61 Inspection commands:

62	<code>list</code>	List packages, groups or individuals from local or
63		remote Poseidon repositories
64	<code>summarise</code>	Get an overview over the content of one or multiple
65		Poseidon packages
66	<code>survey</code>	Survey the degree of context information completeness
67		for Poseidon packages
68	<code>validate</code>	Check Poseidon packages or package components for
69		structural correctness

70 Trident allows to work directly with genotype data (see `-p` below), but its optimized for the interaction
 71 with [Poseidon packages](#), which wrap and contextualize the data. Most trident subcommands therefore have a
 72 central parameter, called `--baseDir` or simply `-d` to specify one or more base directories to look for packages.
 73 For example, if all Poseidon packages live inside a repository at `/path/to/poseidon/packages` you would
 74 simply say `trident <subcommand> -d /path/to/poseidon/dirs/` and `trident` would automatically search
 75 all subdirectories inside of the repository for valid Poseidon packages (as identified by valid `POSEIDON.yml`
 76 files).

77 You can arrange a Poseidon repository in a hierarchical way. For example:

```

78 /path/to/poseidon/packages
79     /modern
80         /2019_poseidon_package1
81         /2019_poseidon_package2
82     /ancient
83         /...
84         /...
85     /Reference_Genomes
86         /...
87         /...

```

88 You can use this structure to select only the level of packages you're interested in, even individual ones, and you
89 can make use of the fact that `-d` can be given multiple times.

90 Being able to specify one or multiple repositories is often not enough, as you may have your own data to
91 co-analyse with the main repository. This is easy to do, as you simply need to provide your own genotype data
92 as yet another Poseidon package to be added to your `trident` command. For example, let's say you have
93 genotype data in `EIGENSTRAT` format (`trident` supports `EIGENSTRAT` and `PLINK` as formats.):

```

94 ~/my_project/my_project.geno
95 ~/my_project/my_project.snp
96 ~/my_project/my_project.ind

```

97 then you can make that to a skeleton Poseidon package with the `init` command. You can also do it manually
98 by simply adding a `POSEIDON.yml` file, with for example the following content:

```

99 poseidonVersion: 2.7.1
100 title: My_awesome_project
101 description: Unpublished genetic data from my awesome project
102 contributor:
103   - name: Stephan Schiffels
104     email: schiffels@institute.org
105 packageVersion: 0.1.0
106 lastModified: 2020-10-07
107 genotypeData:
108   format: EIGENSTRAT
109   genoFile: my_project.geno
110   snpFile: my_project.snp
111   indFile: my_project.ind
112 jannoFile: my_project.janno
113 bibFile: sources.bib

```

114 Two remarks: 1) all file paths are considered *relative* to the directory in which `POSEIDON.yml` resides. For this
115 example we assume that this file is added into the same directory as the three genotype files. 2) Besides the
116 genotype data files there are two (technically optional) files referenced by this example `POSEIDON.yml` file:
117 `sources.bib` and `my_project.janno`. Of course you can add them manually - `init` automatically creates
118 empty dummy versions.

119 Once you have set up your own Poseidon package (which is really only a skeleton so far), you can add it to your
120 `trident` analysis, by simply adding your project directory to the command using `-d`, for example:

```

121 trident list -d /path/to/poseidon/packages/modern \
122     -d /path/to/poseidon/packages/ReferenceGenomes
123     -d ~/my_project --packages

```

1.1 General notes

1.1.1 Logging and command line output

For all subcommands the general argument `--logMode` defines how trident reports messages (to stderr) on the command line:

- *NoLog*: Hides all messages.
- *SimpleLog*: Plain and simple output to stderr.
- *DefaultLog*: Adds severity indicators before each message. (default setting)
- *ServerLog*: Additionally adds timestamps before each message.
- *VerboseLog*: Shows not just messages on the log levels `Info`, `Warning` and `Error` like the other modes, but also on the more verbose level `Debug`. Use this for debugging.

`--debug` is short for `--logMode VerboseLog` to activate this important log level more easily.

1.1.2 Package duplicates and versions

- For `trident` multiple packages in a set of base directories can share the same `title`, if they have different `packageVersion` numbers. If the version numbers are identical or missing, then `trident` stops with an exception.
- The `trident` subcommands `genoconvert`, `list`, `rectify`, `survey` and `validate` by default consider all versions of each Poseidon package in the given base directories. The `--onlyLatest` flag causes them to instead only consider the latest versions.
- `fetch` and `forge` generally consider all package versions and their selection language (see below) allows for detailed version handling.
- `summarize` always only shows results for the latest package versions.

1.1.3 Individual/sample duplicates

- Individual/sample names (`Poseidon_ID`s) within one package have to be unique, or trident will stop.
- We also discourage sample duplicates across packages in package repositories, but trident will generally continue with them. `validate` will fail though, if the `--ignoreDuplicates` flag is not set.
- `forge` offers a special mechanism to resolve sample duplicates within its selection language.

1.1.4 Group names in .fam files

The `.fam` file of Plink-formatted genotype data is used inconsistently across different popular aDNA software tools to store group/population name information. The (global) option `--inPlinkPopName` with the arguments `asFamily` (default), `asPhenotype` and `asBoth` allows to control the reading of the population name from Plink `.fam` files. The subcommands that write genotype data (`forge`, `genoconvert`) have a corresponding option `--outPlinkPopName` to specify this for the output.

1.1.5 Whitespaces in the .janno file

While reading the .janno file `trident` trims all leading and trailing whitespaces around individual cells. Also all instances of the `No-Break Space` unicode character will be removed. This means these whitespaces will not be preserved when a package is `forge` d.

2 Package creation and manipulation commands

2.1 Init command

`init` creates a new, valid Poseidon package from genotype data files. It adds a valid `POSEIDON.yml` file, a dummy .janno file for context information and an empty .bib file for literature references.

[Click here for command line details](#)

```
Usage: trident init ((-p|--genoOne FILE) | --inFormat FORMAT --genoFile FILE
                    --snpFile FILE --indFile FILE) [--snpSet SET]
                    (-o|--outPackagePath DIR) [-n|--outPackageName STRING]
                    [--minimal]
```

Create a new Poseidon package from genotype data

Available options:

<code>-h,--help</code>	Show this help text
<code>-p,--genoOne FILE</code>	One of the input genotype data files. Expects .bed, .bim or .fam for PLINK and .geno, .snp or .ind for EIGENSTRAT. The other files must be in the same directory and must have the same base name.
<code>--inFormat FORMAT</code>	The format of the input genotype data: EIGENSTRAT or PLINK. Only necessary for data input with --genoFile + --snpFile + --indFile.
<code>--genoFile FILE</code>	Path to the input geno file.
<code>--snpFile FILE</code>	Path to the input snp file.
<code>--indFile FILE</code>	Path to the input ind file.
<code>--snpSet SET</code>	The snpSet of the package: 1240K, HumanOrigins or Other. Only relevant for data input with -p --genoOne or --genoFile + --snpFile + --indFile, because the packages in a -d --baseDir already have this information in their respective POSEIDON.yml files. (default: Other)
<code>-o,--outPackagePath DIR</code>	Path to the output package directory.
<code>-n,--outPackageName STRING</code>	The output package name. This is optional: If no name is provided, then the package name defaults to the basename of the (mandatory) --outPackagePath argument. (default: Nothing)
<code>--minimal</code>	Should the output data be reduced to a necessary

197 minimum and omit empty scaffolding?

198 The command

```
199 trident init \  
200 --inFormat EIGENSTRAT/PLINK \  
201 --genoFile path/to/geno_file \  
202 --snpFile path/to/snp_file \  
203 --indFile path/to/ind_file \  
204 --snpSet 1240K|HumanOrigins|Other \  
205 -o path/to/new_package_name
```

206 requires the format (`--inFormat`) of your input data (either `EIGENSTRAT` or `PLINK`), the paths to the
207 respective files (`--genoFile`, `--snpFile`, `--indFile`), and optionally the “shape” of these files (`--snpSet`),
208 so if they cover the `1240K`, the `HumanOrigins` or an `Other` SNP set. A simpler interface is available with
209 `-p (+ --snpSet)`.

	EIGENSTRAT	PLINK
genoFile	.geno	.bed
snpFile	.snp	.bim
indFile	.ind	.fam

210 The output package of `init` is created as a new directory `-o`, which should not already exist, and gets the
211 package `title` corresponding to the basename of `-o`. You can also set the title explicitly with `-n`. The
212 `--minimal` flag causes `init` to create a minimal package with a very basic `POSEIDON.yml` and no `.bib` and
213 `.janno` files.

214 2.2 Fetch command

215 `fetch` allows to download Poseidon packages from a remote Poseidon server via a [Web API](#). Read more about
216 the data available with it [here](#).

217 Click here for command line details

```
218 Usage: trident fetch (-d|--baseDir DIR)  
219             (--downloadAll |  
220             (--fetchFile FILE | (-f|--fetchString DSL)))  
221             [--remoteURL URL] [--archive STRING]
```

222
223 Download data from a remote Poseidon repository

224
225 Available options:

226 <code>-h,--help</code>	Show this help text
227 <code>-d,--baseDir DIR</code>	A base directory to search for Poseidon packages.
228 <code>--downloadAll</code>	Download all packages the server is offering.
229 <code>--fetchFile FILE</code>	A file with a list of packages. Works just as <code>-f</code> , but
230	multiple values can also be separated by newline, not
231	just by comma. <code>-f</code> and <code>--fetchFile</code> can be combined.

232 `-f,--fetchString DSL` List of packages to be downloaded from the remote
 233 server. Package names should be wrapped in asterisks:
 234 `*package_title*`. You can combine multiple values with
 235 comma, so for example: `"*package_1*, *package_2*,`
 236 `*package_3*"`. `fetchString` uses the same parser as
 237 `forgeString`, but does not allow excludes. If groups
 238 or individuals are specified, then packages which
 239 include these groups or individuals are included in
 240 the download.

241 `--remoteURL URL` URL of the remote Poseidon server.
 242 (default: "https://server.poseidon-adna.org")

243 `--archive STRING` The name of the Poseidon package archive that should
 244 be queried. If not given, then the query falls back
 245 to the default archive of the server selected with
 246 `--remoteURL`. See the archive documentation at
 247 https://www.poseidon-adna.org/#/archive_overview for
 248 a list of archives currently available from the
 249 official Poseidon Web API. (default: Nothing)

250 It works with

```
251 trident fetch -d ... -d ... \
252   -f "*package_title_1*,*package_title_2-1.0.1*,group_name,<individual1>"
```

253 and the entities you want to download must be listed either in a simple string of comma-separated values, which
 254 can be passed via `-f / --fetchString`, or in a text file (`--fetchFile`). Entities are then combined from
 255 these sources.

256 Entities are specified using a special syntax (see also the documentation of `forge` below): packages are wrapped
 257 in asterisks, with or without version appended after a dash (e.g. `*package_title*` or `*package_title-1.2.3`),
 258 group names are spelled as is, and individual names are wrapped in angular brackets (e.g. `<individual1>`).
 259 Fetch will figure out which packages need to be downloaded to include all specified entities. `--downloadAll`,
 260 which can be given instead of `-f` and `--fetchFile`, causes fetch to download all packages from the server.
 261 The downloaded packages are added in the first (!) `-d` directory (which gets created if it doesn't exist), but
 262 downloads are only performed if the respective packages are not already present in the latest version in any of
 263 the `-d` dirs.

264 Note that `trident fetch` makes most sense in combination with `trident list --remote`: First one can
 265 inspect what is available on the server, then one can create a custom fetch command.

266 `fetch` also has the optional arguments `--remote https://...` to name an alternative Poseidon server
 267 and `--archive` to select a Poseidon archive on the server. Here is a list of the [archives available on the official](#)
 268 [Poseidon server](#).

269 2.3 Forge command

270 `forge` creates new Poseidon packages by extracting and merging packages, populations and individuals/samples
 271 from your Poseidon repositories.

272 [Click here for command line details](#)

```

273 Usage: trident forge ((-d|--baseDir DIR) |
274                      ((-p|--genoOne FILE) | --inFormat FORMAT --genoFile FILE
275                      --snpFile FILE --indFile FILE) [--snpSet SET])
276                      [--forgeFile FILE | (-f|--forgeString DSL)]
277                      [--selectSnps FILE] [--intersect] [--outFormat FORMAT]
278                      [--minimal] [--onlyGeno] (-o|--outPackagePath DIR)
279                      [-n|--outPackageName STRING] [--packagewise]
280                      [--outPlinkPopName MODE]
281
282 Select packages, groups or individuals and create a new Poseidon package from
283 them
284
285 Available options:
286 -h,--help                Show this help text
287 -d,--baseDir DIR         A base directory to search for Poseidon packages.
288 -p,--genoOne FILE        One of the input genotype data files. Expects .bed,
289                          .bim or .fam for PLINK and .geno, .snp or .ind for
290                          EIGENSTRAT. The other files must be in the same
291                          directory and must have the same base name.
292 --inFormat FORMAT        The format of the input genotype data: EIGENSTRAT or
293                          PLINK. Only necessary for data input with --genoFile
294                          + --snpFile + --indFile.
295 --genoFile FILE          Path to the input geno file.
296 --snpFile FILE           Path to the input snp file.
297 --indFile FILE           Path to the input ind file.
298 --snpSet SET             The snpSet of the package: 1240K, HumanOrigins or
299                          Other. Only relevant for data input with -p|--genoOne
300                          or --genoFile + --snpFile + --indFile, because the
301                          packages in a -d|--baseDir already have this
302                          information in their respective POSEIDON.yml files.
303                          (default: Other)
304 --forgeFile FILE         A file with a list of packages, groups or individual
305                          samples. Works just as -f, but multiple values can
306                          also be separated by newline, not just by comma.
307                          Empty lines are ignored and comments start with "#",
308                          so everything after "#" is ignored in one line.
309                          Multiple instances of -f and --forgeFile can be
310                          given. They will be evaluated according to their
311                          input order on the command line.
312 -f,--forgeString DSL     List of packages, groups or individual samples to be
313                          combined in the output package. Packages follow the
314                          syntax *package_title*, populations/groups are simply
315                          group_id and individuals <individual_id>. You can
316                          combine multiple values with comma, so for example:
317                          "*package_1*, <individual_1>, <individual_2>,"

```

group_1". Duplicates are treated as one entry.

Negative selection is possible by prepending "-" to the entity you want to exclude (e.g. "*package_1*, -<individual_1>, -group_1"). forge will apply excludes and includes in order. If the first entity is negative, then forge will assume you want to merge all individuals in the packages found in the baseDirs (except the ones explicitly excluded) before the exclude entities are applied. An empty forgeString (and no --forgeFile) will therefore merge all available individuals. If there are individuals in your input packages with equal individual id, but different main group or source package, they can be specified with the special syntax "<package:group:individual>".

--selectSnps FILE To extract specific SNPs during this forge operation, provide a Snp file. Can be either Eigenstrat (file ending must be '.snp') or Plink (file ending must be '.bim'). When this option is set, the output package will have exactly the SNPs listed in this file. Any SNP not listed in the file will be excluded. If option '--intersect' is also set, only the SNPs overlapping between the SNP file and the forged packages are output. (default: Nothing)

--intersect Whether to output the intersection of the genotype files to be forged. The default (if this option is not set) is to output the union of all SNPs, with genotypes defined as missing in those packages which do not have a SNP that is present in another package. With this option set, the forged dataset will typically have fewer SNPs, but less missingness.

--outFormat FORMAT The format of the output genotype data: EIGENSTRAT or PLINK. (default: PLINK)

--minimal Should the output data be reduced to a necessary minimum and omit empty scaffolding?

--onlyGeno Should only the resulting genotype data be returned? This means the output will not be a Poseidon package.

-o,--outPackagePath DIR Path to the output package directory.

-n,--outPackageName STRING The output package name. This is optional: If no name is provided, then the package name defaults to the basename of the (mandatory) --outPackagePath argument. (default: Nothing)

--packagewise Skip the within-package selection step in forge. This will result in outputting all individuals in the

relevant packages, and hence a superset of the requested individuals/groups. It may result in better performance in cases where one wants to forge entire packages or almost entire packages. Details: Forge conceptually performs two types of selection: First, it identifies which packages in the supplied base directories are relevant to the requested forge, i.e. whether they are either explicitly listed using `*PackageName*`, or because they contain selected individuals or groups. Second, within each relevant package, individuals which are not requested are removed. This option skips only the second step, but still performs the first.

`--outPlinkPopName MODE` Where to write the population/group name into the FAM file in Plink-format. Three options are possible: `asFamily` (default) | `asPhenotype` | `asBoth`. See also `--inPlinkPopName`.

`forge` can be used with

```
trident forge -d ... -d ... \
  -f "*package_name*, group_id, <individual_id>" \
  -o path/to/new_package_name
```

where the entities (packages, groups/populations, individuals/samples) you want in the output package can be denoted either as a string on the command line (`-f / --forgeString`), or in an input text file (`--forgeFile`). See the section below for the syntax of this selection language. Do not forget to wrap the `--forgeString` query in quotes.

Including one or multiple Poseidon packages with `-d` is not the only way to include data for a forge operation. It is also possible to consider unpackaged genotype data directly with `-p (+ --snpSet)` or `--inFormat + --genoFile + --snpFile + --indFile (+ --snpSet)`. This makes the following example possible, where we merge data from one Poseidon package and two genotype datasets to get a new EIGENSTRAT dataset.

```
trident forge \
  -d 2017_GonzalesFortesCurrentBiology \
  -p 2018_VeeramahPNAS/2018_VeeramahPNAS.fam \
  --inFormat PLINK \
  --genoFile 2017_HaberAJHG/2017_HaberAJHG.bed \
  --snpFile 2017_HaberAJHG/2017_HaberAJHG.bim \
  --indFile 2017_HaberAJHG/2017_HaberAJHG.fam \
  -f "<STR241.SG>,<ERS1790729.SG>,Iberia_HG.SG" \
  -o testpackage \
  --outFormat EIGENSTRAT \
  --onlyGeno
```

2.3.1 The forge selection language

The text in `--forgeString`, `--forgeFile` (and with limited syntax also in `--fetchString` and `--fetchFile`) are parsed as a domain specific query language that describes precisely which entities should be compiled in the output package of a given `forge` operation. The language has multiple syntactic elements and a specific evaluation logic.

In general a `--forgeString` query consists of multiple entities, separated by `,`. The main entities are Poseidon packages, groups/populations and individuals/samples:

- Each package title is surrounded by `*: *package*`. That means if you want all individuals of the Poseidon package `2019_Jeong_InnerEurasia` in the output package you would add `*2019_Jeong_InnerEurasia*` to the query.
- Groups/populations are not specially marked: `group`. So to get all individuals of the group `Swiss_Roman_period`, you would simply add `Swiss_Roman_period`.
- Individuals/samples are surrounded by `<` and `>`: `<individual>`. `ALA026` therefore becomes `<ALA026>`. A second way to denote individuals is with the more verbose and specific syntax `<package:group:individual>`. Such defined individuals take precedence over differently defined ones (so: directly with `<individual>` or as a subset of `*package*` or `group`). This allows to resolve duplication issues precisely – at least in cases where the duplicated individuals differ in source package or primary group.
- Package versions can be appended to package names, such as `*package-1.2.3*`, or `<package-1.2.3:group:individual>`.

In the `--forgeFile` each line is treated as a separate `forgeString`, empty lines are ignored and `#`s start comments. So this is a valid example of a `forgeFile`:

```
# Packages
*package1*, *package2-1.2.3*

# Groups and individuals from other packages beyond package1 and package2
group1, <individual1>, group2, <individual2>, <pac1:group2:individual3>

# group2 has two outlier individuals that should be ignored
-<individual1> # This one has very low coverage
-<pac2:group3:individual4> # This one is from a different time period
```

By prepending `-` to entities, we can exclude them from the forged package (this feature is not available for `fetch`). `forge` figures out the final list of samples to include by executing all `forge`-entities in order. So an entity list `*PackageA*,-<Individual1>,GroupA` may result in a different outcome than `*PackageA*,GroupA,-<Individual1>`, depending on whether `<Individual1>` belongs to `GroupA` or not.

If the `forge` entity list starts with a negative entity, or if the entity list is empty, `forge` will implicitly assume you want to include all individuals in all **latest** versions of packages found in the base directories (except the ones explicitly excluded, of course).

The specific semantics of the various ways to include or exclude entities are:

2.3.1.1 Inclusion queries

- `*Pac1*`: Select all individuals in the latest version of package “Pac1”
- `*Pac1-1.0.1*`: Select all individuals in package “Pac1” with version “1.0.1”

- **Group1** : Select all individuals associated with “Group1” in all latest versions of all packages
- **<Ind1>** : Select the individual named “Ind1”, searching in all latest packages.
- **<Pac1:Group1:Ind1>** : Select the individual named “Ind1” associated with “Group1” in the latest version of package “Pac1”
- **<Pac1-1.0.1:Group1:Ind1>** : Select the individual named “Ind1” associated with “Group1” in the package “Pac1” with version “1.0.1”

2.3.1.2 Exclusion queries

- **-*Pac1*** : Remove all individuals in all versions of package “Pac1”
- **-*Pac1-1.0.1*** : Remove only individuals in package “Pac1” with version “1.0.1” (but leave other versions in)
- **-Group1** : Remove all individuals associated with “Group1” in all versions of all packages (not just the latest)
- **-<Ind1>** : Remove all individuals named “Ind1” in all versions of all packages (not just the latest).
- **-<Pac1:Group1:Ind1>** : Remove the individual named “Ind1” associated with “Group1”, searching in all versions of package “Pac1”
- **-<Pac1-1.0.1:Group1:Ind1>** : Remove the individual named “Ind1” associated with “Group1”, but only if they are in “Pac1” with version “1.0.1”

If a query results in multiple individuals with the same name, forge will throw an error.

2.3.2 Treatment of the .janno file while merging

forge merges and subsets .janno files along with the genotype data. If a package lacks a .janno file, then a basic one will be created internally based on the information in the genotype data, and used for the output. Missing columns across packages will be filled with **n/a**.

For merging two .janno files **A** and **B** the following rules apply regarding undefined, arbitrary additional columns:

- If **A** has an additional column which is not in **B** then empty cells in the rows imported from **B** are filled with **n/a**.
- If **A** and **B** share additional columns with identical column name, then they are treated as semantically identical units and merged accordingly.
- In the resulting .janno file, all additional columns from both **A** and **B** are sorted alphabetically and appended after the normal, specified variables.

The following example illustrates the described behaviour:

A.janno

Poseidon_ID	Group_Name	Genetic_Sex	AdditionalColumn1	AdditionalColumn2
XXX011	POP1	M	A	D
XXX012	POP2	F	B	E
XXX013	POP1	M	C	F

B.janno

Poseidon_ID	Group_Name	Genetic_Sex	AdditionalColumn3	AdditionalColumn2
YYY022	POP5	F	G	J
YYY023	POP5	F	H	K
YYY024	POP5	M	I	L

A.janno + B.janno

Poseidon_ID	Group_Name	Genetic_Sex	AdditionalColumn1	AdditionalColumn2	AdditionalColumn3
XXX011	POP1	M	A	D	n/a
XXX012	POP2	F	B	E	n/a
XXX013	POP1	M	C	F	n/a
YYY022	POP5	F	n/a	J	G
YYY023	POP5	F	n/a	K	H
YYY024	POP5	M	n/a	L	I

2.3.3 Treatment of the .ssf file while merging

The Sequencing Source File (short .ssf file) is forged in exactly the same way as the janno file. SSF files that are present are included in the forge product in the way that the user expects, following selection of those entities which are listed in the `poseidon_IDs` columns of the SSF files. Columns that are only present in some packages, including those not defined by our [Schema] are also included in the forged product in the same way as described for Janno above.

2.3.4 Treatment of the .bib file while merging

In the forge process all relevant samples for the output package are determined. This includes their .janno entries and therefore the information on the publication keys documented for them in the .janno `Publication` column. The output .bib file compiles only the relevant references for the samples in the output package. It includes the references exactly once and is sorted alphabetically (by key).

2.3.5 Other options

Just as for `init` the output package of `forge` is created as a new directory `-o`. The title can also be explicitly defined with `-n`.

`--minimal` allows for the creation of a minimal output package without `.bib` and `.janno`. This is especially useful for data analysis pipelines, where only the genotype data is required. Even more basic output comes with `--onlyGeno`, which means that only the genotype data is returned without any Poseidon package.

`forge` has a an optional flag `--intersect`, that defines, if the genotype data from different packages should be merged with an `union` or an `intersect` operation. The default (if this option is not set) is to output the union of all SNPs, with genotypes defined as missing in samples from packages which do not have a SNP that is present in another package. With this option set, on the other hand, the forged dataset will typically have fewer SNPs, but less missingness.

`--intersect` also influences the automatic determination of the `snpSet` field in the POSEIDON.yml file for the resulting package. If the `snpSet`s of all input packages are identical, then the resulting package will just inherit this configuration. Otherwise `forge` applies the following pairwise merging logic:

Input snpSet A	Input snpSet B	--intersect	Ouput snpSet
Other	*	*	Other
1240K	HumanOrigins	True	HumanOrigins
1240K	HumanOrigins	False	1240K

503 `--selectSnps` allows to provide `forge` with a SNP file in EIGENSTRAT (`.snp`) or PLINK (`.bim`) format
504 to create a package with a specific selection. When this option is set, the output package will have exactly the
505 SNPs listed in this file. Any SNP not listed in the file will be excluded. If `--intersect` is also set, only the
506 SNPs overlapping between the SNP file and the forged packages are output.

507 Merging genotype data across different data sources and file formats is tricky. `forge` is more verbose about
508 potential issues, if the `--logMode` flag is set to `VerboseLog`.

509 The `--onlyGeno` command specifies that only genotype data should be output, not an entire Poseidon package.

510 With `--packagewise` the within-package selection step in `forge` can be skipped. This will result in outputting
511 all individuals in the relevant packages, and hence a superset of the requested individuals/groups. It may result
512 in better performance in cases where one wants to forge entire packages.

513 2.4 Genoconvert command

514 `genoconvert` converts the genotype data in a Poseidon package to a different file format. The respective entries
515 in the POSEIDON.yml file are changed accordingly.

516 [Click here for command line details](#)

517 Usage: trident genoconvert ((-d|--baseDir DIR) |
518 ((-p|--genoOne FILE) | --inFormat FORMAT
519 --genoFile FILE --snpFile FILE --indFile FILE)
520 [--snpSet SET]) --outFormat FORMAT [--onlyGeno]
521 [-o|--outPackagePath DIR] [--removeOld]
522 [--outPlinkPopName MODE] [--onlyLatest]

524 Convert the genotype data in a Poseidon package to a different file format

526 Available options:

527 <code>-h,--help</code>	Show this help text
528 <code>-d,--baseDir DIR</code>	A base directory to search for Poseidon packages.
529 <code>-p,--genoOne FILE</code>	One of the input genotype data files. Expects <code>.bed</code> , 530 <code>.bim</code> or <code>.fam</code> for PLINK and <code>.geno</code> , <code>.snp</code> or <code>.ind</code> for 531 EIGENSTRAT. The other files must be in the same 532 directory and must have the same base name.
533 <code>--inFormat FORMAT</code>	The format of the input genotype data: EIGENSTRAT or 534 PLINK. Only necessary for data input with <code>--genoFile</code> 535 <code>+ --snpFile + --indFile</code> .
536 <code>--genoFile FILE</code>	Path to the input geno file.
537 <code>--snpFile FILE</code>	Path to the input snp file.
538 <code>--indFile FILE</code>	Path to the input ind file.

539 `--snpSet SET` The `snpSet` of the package: 1240K, HumanOrigins or
540 Other. Only relevant for data input with `-p|--genoOne`
541 or `--genoFile + --snpFile + --indFile`, because the
542 packages in a `-d|--baseDir` already have this
543 information in their respective POSEIDON.yml files.
544 (default: Other)
545 `--outFormat FORMAT` the format of the output genotype data: EIGENSTRAT or
546 PLINK.
547 `--onlyGeno` Should only the resulting genotype data be returned?
548 This means the output will not be a Poseidon package.
549 `-o,--outPackagePath DIR` Path to the output package directory. This is
550 optional: If no path is provided, then the output is
551 written to the directories where the input genotype
552 data file (.bed/.geno) is stored. (default: Nothing)
553 `--removeOld` Remove the old genotype files when creating the new
554 ones.
555 `--outPlinkPopName MODE` Where to write the population/group name into the FAM
556 file in Plink-format. Three options are possible:
557 asFamily (default) | asPhenotype | asBoth. See also
558 `--inPlinkPopName`.
559 `--onlyLatest` Consider only the latest versions of packages, or the
560 groups and individuals within the latest versions of
561 packages, respectively.

562 With the default setting

563 `trident genoconvert -d ... -d ... --outFormat EIGENSTRAT|PLINK`

564 all packages in `-d` will be converted to the desired `--outFormat` (either `EIGENSTRAT` or `PLINK`), if the data
565 is not already in this format. This includes updating the respective POSEIDON.yml files.

566 The “old” data is not deleted, but kept around. That means conversion can result in a package with both PLINK
567 and EIGENSTRAT data, but only one is linked in the POSEIDON.yml file, and that is what will be used by
568 trident. To delete the old data in the conversion you can add the `--removeOld` flag.

569 Instead of `-d` to change Poseidon packages, the `-p (+ --snpSet)` or `--inFormat + --genoFile + --snpFile + --indFi`
570 allow to directly convert genotype data that is not wrapped in a Poseidon package and store it to a directory
571 given in `-o`. See this example:

572 `trident genoconvert \`
573 `-p 2018_Mittnik_Baltic/Mittnik_Baltic.bed \`
574 `--outFormat EIGENSTRAT`
575 `-o my_directory`

576 2.5 Rectify command

577 `rectify` automatically harmonizes POSEIDON.yml files of one or multiple packages. This is not an automatic
578 update from one Poseidon version to the next, but rather a clean-up wizard after manual modifications.

579 [Click here for command line details](#)

```

580 Usage: trident rectify (-d|--baseDir DIR) [--ignorePoseidonVersion]
581      [--poseidonVersion ?.??.?]
582      [--packageVersion VPART [--logText STRING]]
583      [--checksumAll | [--checksumGeno] [--checksumJanno]
584      [--checksumSSF] [--checksumBib]]
585      [--newContributors DSL] [--onlyLatest]
586
587 Adjust POSEIDON.yml files automatically to package changes
588
589 Available options:
590 -h,--help          Show this help text
591 -d,--baseDir DIR    A base directory to search for Poseidon packages.
592 --ignorePoseidonVersion Read packages even if their poseidonVersion is not
593                      compatible with trident.
594 --poseidonVersion ?.??.? Poseidon version the packages should be updated to:
595                      e.g. "2.5.3".
596 --packageVersion VPART Part of the package version number in the
597                      POSEIDON.yml file that should be updated: Major,
598                      Minor or Patch (see https://semver.org).
599 --logText STRING     Log text for this version in the CHANGELOG file.
600 --checksumAll        Update all checksums.
601 --checksumGeno       Update genotype data checksums.
602 --checksumJanno      Update .janno file checksum.
603 --checksumSSF        Update .ssf file checksum
604 --checksumBib        Update .bib file checksum.
605 --newContributors DSL Contributors to add to the POSEIDON.yml file in the
606                      form "[Firstname Lastname](Email address);...".
607 --onlyLatest         Consider only the latest versions of packages, or the
608                      groups and individuals within the latest versions of
609                      packages, respectively.

```

610 It can be called with a lot of optional arguments:

```

611 trident rectify -d ... -d ... \
612   --poseidonVersion "X.X.X" \
613   --packageVersion Major|Minor|Patch \
614   --logText "short description of the update"
615   --checksumAll
616   --newContributors "[Firstname Lastname](Email address);..."

```

617 These arguments determine which fields of the POSEIDON.yml file should be modified.

- 618 • `--poseidonVersion` allows a simple change of the `poseidonVersion` field in the POSEIDON.yml file.
- 619 • `--packageVersion` increments the package version number in the first, the second or the third position.
620 It can optionally be called with `--logText`, which appends an entry to the CHANGELOG file for the
621 respective package version update. `--logText` also creates a new CHANGELOG file if it does not exist
622 yet.
- 623 • `--checksumGeno`, `--checksumJanno`, `--checksumSSF` and `--checksumBib` add or modify the respec-

624 tive checksum fields in the POSEIDON.yml file. `--checksumAll` is a wrapper to call all of them at
 625 once.

- 626 • `--newContributors` adds new contributors.

627 :warning: As `rectify` reads and rewrites POSEIDON.yml files, it may change their inner order, layout or
 628 even content (e.g. if they have fields which are not in the `POSEIDON.yml` definition). Create a backup of the
 629 POSEIDON.yml file before running `rectify` if you are uncertain if this might affect you negatively.

630 3 Inspection commands

631 3.1 List command

632 `list` lists packages, groups and individuals of the datasets you use, or of the packages available on the server.

633 Click here for command line details

```
634 Usage: trident list ((-d|--baseDir DIR) | --remote [--remoteURL URL]
635                  [--archive STRING])
636                  (--packages | --groups | --individuals
637                  [-j|--jannoColumn COLNAME]) [--raw] [--onlyLatest]
```

639 List packages, groups or individuals from local or remote Poseidon
 640 repositories

642 Available options:

643 <code>-h,--help</code>	Show this help text
644 <code>-d,--baseDir DIR</code>	A base directory to search for Poseidon packages.
645 <code>--remote</code>	List packages from a remote server instead the local 646 file system.
647 <code>--remoteURL URL</code>	URL of the remote Poseidon server. 648 (default: "https://server.poseidon-adna.org")
649 <code>--archive STRING</code>	The name of the Poseidon package archive that should 650 be queried. If not given, then the query falls back 651 to the default archive of the server selected with 652 <code>--remoteURL</code> . See the archive documentation at 653 https://www.poseidon-adna.org/#/archive_overview for 654 a list of archives currently available from the 655 official Poseidon Web API. (default: Nothing)
656 <code>--packages</code>	List all packages.
657 <code>--groups</code>	List all groups, ignoring any group names after the 658 first as specified in the .janno-file.
659 <code>--individuals</code>	List all individuals/samples.
660 <code>-j,--jannoColumn COLNAME</code>	List additional fields from the janno files, using 661 the .janno column heading name, such as "Country", 662 "Site", "Date_C14_Uncal_BP", etc..
663 <code>--raw</code>	Return the output table as tab-separated values 664 without header. This is useful for piping into grep

665 or awk.

666 `--onlyLatest` Consider only the latest versions of packages, or the
667 groups and individuals within the latest versions of
668 packages, respectively.

669 To list packages from your local repositories, as seen above you can run

670 `trident list -d ... -d ... --packages`

671 This will yield a nicely formatted table of all packages, their version and the number of individuals in them.

672 You can use `--remote` to show packages on the remote server. For example

673 `trident list --packages --remote --archive "community-archive"`

674 will result in a view of all packages available in one of the [public online archives](#). Just as for `fetch`, the
675 `--archive` flag allows to choose which public archive to query.

676 Independent of whether you query a local or an online archive, you can not just list packages, but also groups,
677 as defined in the third column of EIGENSTRAT `.ind` files (or the first/last column of a PLINK `.fam` file),
678 and individuals with the flags `--groups` and `--individuals` (instead of `--packages`).

679 The `--individuals` flag additionally provides a way to immediately access information from `.janno`
680 files on the command line. This works with the `-j/--jannoColumn` option. For example adding
681 `-j Country -j Date_C14_Uncal_BP` to the commands above will add the `Country` and the `Date_C14_Uncal_BP`
682 columns to the respective output tables.

683 Note that if you want a less fancy table, for example because you want to load this into Excel, or pipe into
684 another command that cannot deal with the table layout, you can use the `--raw` option to output that table as
685 a simple tab-delimited stream.

686 3.2 Summarise command

687 `summarise` prints some general summary statistics for a given poseidon dataset taken from the `.janno` files.

688 [Click here for command line details](#)

689 Usage: `trident summarise (-d|--baseDir DIR) [--raw]`

690
691 Get an overview over the content of one or multiple Poseidon packages

692
693 Available options:

694 <code>-h,--help</code>	Show this help text
695 <code>-d,--baseDir DIR</code>	A base directory to search for Poseidon packages.
696 <code>--raw</code>	Return the output table as tab-separated values 697 without header. This is useful for piping into <code>grep</code> 698 or <code>awk</code> .

699 You can run it with

700 `trident summarise -d ... -d ...`

701 which will show you context information like – among others – the number of individuals in the dataset, their
702 sex distribution, the mean age of the samples (for ancient data) or the mean coverage on the 1240K SNP array

703 in a table. `summarise` depends on complete .janno files and will silently ignore missing information.
704 You can use the `--raw` option to output the summary table in a simple, tab-delimited layout.

705 3.3 Survey command

706 `survey` tries to indicate package completeness (mostly focused on `.janno` files) for poseidon datasets.

707 [Click here for command line details](#)

708 Usage: trident survey (-d|--baseDir DIR) [--raw] [--onlyLatest]

709
710 Survey the degree of context information completeness for Poseidon packages

711
712 Available options:

713 -h,--help	Show this help text
714 -d,--baseDir DIR	A base directory to search for Poseidon packages.
715 --raw	Return the output table as tab-separated values without header. This is useful for piping into grep or awk.
716	
717	
718 --onlyLatest	Consider only the latest versions of packages, or the groups and individuals within the latest versions of packages, respectively.
719	
720	

721 Running

722 `trident survey -d ... -d ...`

723 will yield a table with one row for each package. See `trident survey -h` for a legend which cell of this table
724 means what.

725 Again you can use the `--raw` option to output the survey table in a tab-delimited format.

726 3.4 Validate command

727 `validate` checks Poseidon packages and individual package components for structural correctness.

728 [Click here for command line details](#)

729 Usage: trident validate ((-d|--baseDir DIR) [--ignoreGeno] [--fullGeno]
730 [--ignoreDuplicates] [-c|--ignoreChecksums]
731 [--ignorePoseidonVersion] |
732 --pyml FILE | (-p|--genoOne FILE) | --inFormat FORMAT
733 --genoFile FILE --snfFile FILE --indFile FILE |
734 --janno FILE | --ssf FILE | --bib FILE) [--noExitCode]
735 [--onlyLatest]

736
737 Check Poseidon packages or package components for structural correctness

738
739 Available options:

740 -h,--help	Show this help text
741 -d,--baseDir DIR	A base directory to search for Poseidon packages.

```

742 --ignoreGeno          Ignore snp and geno file.
743 --fullGeno           Test parsing of all SNPs (by default only the first
744                      100 SNPs are probed).
745 --ignoreDuplicates    Do not stop on duplicated individual names in the
746                      package collection.
747 -c,--ignoreChecksums Whether to ignore checksums. Useful for speedup in
748                      debugging.
749 --ignorePoseidonVersion Read packages even if their poseidonVersion is not
750                      compatible with trident.
751 --pyml FILE           Path to a POSEIDON.yml file.
752 -p,--genoOne FILE     One of the input genotype data files. Expects .bed,
753                      .bim or .fam for PLINK and .geno, .snp or .ind for
754                      EIGENSTRAT. The other files must be in the same
755                      directory and must have the same base name.
756 --inFormat FORMAT      The format of the input genotype data: EIGENSTRAT or
757                      PLINK. Only necessary for data input with --genoFile
758                      + --snpFile + --indFile.
759 --genoFile FILE        Path to the input geno file.
760 --snpFile FILE         Path to the input snp file.
761 --indFile FILE         Path to the input ind file.
762 --janno FILE           Path to a .janno file.
763 --ssf FILE            Path to a .ssf file.
764 --bib FILE            Path to a .bib file.
765 --noExitCode           Do not produce an explicit exit code.
766 --onlyLatest           Consider only the latest versions of packages, or the
767                      groups and individuals within the latest versions of
768                      packages, respectively.

769 You can run it with

770 trident validate -d ... -d ...

771 to check packages and it will either report a success ( Validation passed ) or failure with specific error messages.

772 Instead of validating entire packages with -d you can also apply it to individual files and package components:
773 --pyml (POSEIDON.yml), -p | --inFormat + --genoFile + --snpFile + --indFile (genotype data),
774 --janno (.janno file), --ssf (.ssf file) or --bib (.bib file). In this case validate attempts to read and
775 parse the respective files individually and reports any issues it encounters. Note that this considers the files in
776 isolation and does not include any cross-file consistency checks.

777 When applied to packages, validate tries to ensure that each package adheres to the schema definition. Here
778 is a list of what is checked:

779 • Structural correctness of the POSEIDON.yml file.
780 • Presence of all files references in the POSEIDON.yml file.
781 • Full structural correctness of .janno, .ssf and .bib file.
782 • Superficial correctness of genotype data files by parsing the first 100 SNPs. A full check that parses all SNPs
783   can be triggered with the --fullGeno option. --ignoreGeno, on the other hand, causes validate to
784   ignore the genotype data entirely, which speeds up the validation significantly.

```

785 • Correspondence of BibTeX keys in .bib and .janno
786 • Correspondence of sample IDs in .janno and .ssf.
787 • Correspondence of sample and group IDs in .janno and genotype data files.

788 In fact much of this validation already runs as part of the general package reading pipeline invoked for other
789 trident subcommands (e.g. `forge`). `validate` is meant to be more thorough/brittle, though, and will explicitly
790 fail if even a single package is broken. For special cases more flexibility can be enabled with the options
791 `--ignoreDuplicates`, `--ignoreChecksums` and `--ignorePoseidonVersion`.

792 Remember to run `validate` it with `--debug` to get more information in case the default output is not sufficient
793 to analyse an issue.
