## 0.1 Guide for trident v0.28.0

### 0.1.1 Poseidon package repositories

Trident generally requires Poseidon datasets to work with. Most trident subcommands therefore have a central parameter, called `--baseDir` or simply `-d` to specify one or more base directories to look for Poseidon packages. For example, if all Poseidon packages live inside a repository at `/path/to/poseidon/packages` you would simply say `trident <subcommand> -d /path/to/poseidon/dirs/` and `trident` would automatically search all subdirectories inside of the repository for valid poseidon packages (as identified by valid `POSEIDON.yml` files).

You can arrange a poseidon repository in a hierarchical way. For example:

```
/path/to/poseidon/packages
  /modern
    /2019_poseidon_package1
    /2019_poseidon_package2
  /ancient
    /...
    /...
  /Reference_Genomes
    /...
    /...
  /Archaic_Humans
    /...
    /...
```

You can use this structure to select only the level of packages you're interested in, and you can make use of the fact that `-d` can be given multiple times.

Let's use the `list` command to list all packages in the `modern` and `Reference_Genomes`:

```
trident list -d /path/to/poseidon/packages/modern \
-d /path/to/poseidon/packages/ReferenceGenomes --packages
```

### 0.1.2 Analysing your own dataset outside of the main repository

Being able to specify one or multiple repositories is often not enough, as you may have your own data to co-analyse with the main repository. This is easy to do, as you simply need to provide your own genotype data as yet another poseidon package to be added to your `trident list` command. For example, let's say you have genotype data in `EIGENSTRAT` format (`trident` supports `EIGENSTRAT` and `PLINK` as formats.):

```
~/my_project/my_project.geno
```

40 ~/my\_project/my\_project.snp

41 ~/my\_project/my\_project.ind

42 then you can make that to a skeleton Poseidon package with the **init** command. You can also do it manually by  
43 simply adding a POSEIDON.yml file, with for example the following content:

```
44 poseidonVersion: 2.5.0
45 title: My_awesome_project
46 description: Unpublished genetic data from my awesome project
47 contributor:
48   - name: Stephan Schiffels
49     email: schiffels@institute.org
50 packageVersion: 0.1.0
51 lastModified: 2020-10-07
52 genotypeData:
53   format: EIGENSTRAT
54   genoFile: my_project.geno
55   snpFile: my_project.snp
56   indFile: my_project.ind
57   jannoFile: my_project.janno
58   bibFile: sources.bib
```

59 Two remarks: 1) all file paths are considered *relative* to the directory in which POSEIDON.yml resides. Here I  
60 assume that you put this file into the same directory as the three genotype files. 2) Besides the genotype data  
61 files there are two (technically optional) files referenced by this example POSEIDON.yml file: **sources.bib** and  
62 **my\_project.janno**. Of course you can add them manually - **init** automatically creates empty dummy versions.  
63 Once you have set up your own “Poseidon” package (which is really only a skeleton so far), you can add it to  
64 your **trident** analysis, by simply adding your project directory to the command using **-d**:

```
65 trident list -d /path/to/poseidon/packages/modern \
66   -d /path/to/poseidon/packages/ReferenceGenomes
67   -d ~/my_project --packages
```

### 68 0.1.3 Package creation and manipulation commands

69 **0.1.3.1 Init command** **init** creates a new, valid poseidon package from genotype data files. It adds a valid  
70 POSEIDON.yml file, a dummy .janno file for context information and an empty .bib file for literature references.

71 [Click here for command line details](#)

```
72 Usage: trident init (-r|--inFormat ARG) (-g|--genoFile ARG) (-s|--snpFile ARG)
73               (-i|--indFile ARG) [--snpSet ARG] (-o|--outPackagePath ARG)
74               [-n|--outPackageName ARG] [--minimal]
```

75 Create a new Poseidon package from genotype data

76  
77 Available options:

```
78 -h,--help          Show this help text
79 -r,--inFormat ARG  the format of the input genotype data: EIGENSTRAT or
80                   PLINK
```

```

81  -g,--genoFile ARG      the input geno file path
82  -s,--snpFile ARG      the input snp file path
83  -i,--indFile ARG      the input ind file path
84  --snpSet ARG          the snpSet of the new package: 1240K, HumanOrigins or
85                        Other. Default: Other
86  -o,--outPackagePath ARG the output package directory path
87  -n,--outPackageName ARG the output package name - this is optional: If no
88                        name is provided, then the package name defaults to
89                        the basename of the (mandatory) --outPackagePath
90                        argument
91  --minimal              should only a minimal output package be created?

```

92 The command

```

93 trident init \
94   -r EIGENSTRAT/PLINK \
95   -g path/to/geno_file \
96   -s path/to/snp_file \
97   -i path/to/ind_file \
98   --snpSet 1240K|HumanOrigins|Other \
99   -o path/to/new_package_name

```

100 requires the format `-r` (`--inFormat`) of your input data (either `EIGENSTRAT` or `PLINK`), the paths to the  
101 respective files in `-g` (`--genoFile`), `-s` (`--snpFile`), and `-i` (`--indFile`), and optionally the “shape” of these  
102 files (`--snpSet`), so if they cover the 1240K, the HumanOrigins or an Other SNP set.

	EIGENSTRAT	PLINK
genoFile	.geno	.bed
snpFile	.snp	.bim
indFile	.ind	.fam

103 The output package of `init` is created as a new directory `-o`, which should not already exist, and gets the  
104 package `title` corresponding to the basename of `-o`. You can also set the title explicitly with `-n`. The `--minimal`  
105 flag causes `init` to create a minimal package with a very basic `POSEIDON.yml` and no `.bib` and `.janno` files.

106 **0.1.3.2 Fetch command** `fetch` allows to download poseidon packages from a remote poseidon server.

107 [Click here for command line details](#)

```

108 Usage: trident fetch (-d|--baseDir DIR) [-f|--fetchString ARG] [--fetchFile ARG]
109                        [--remoteURL ARG] [-u|--upgrade] [--downloadAll]

```

110 Download data from a remote Poseidon repository

111 Available options:

```

113  -h,--help              Show this help text
114  -d,--baseDir DIR      a base directory to search for Poseidon Packages
115                        (could be a Poseidon repository)
116  -f,--fetchString ARG  List of packages to be downloaded from the remote

```

server. Package names should be wrapped in asterisks: `*package_title*`. You can combine multiple values with comma, so for example: `"*package_1*, *package_2*, *package_3*"`. `fetchString` uses the same parser as `forgeString`, but does not allow excludes. If groups or individuals are specified, then packages which include these groups or individuals are included in the download.

`--fetchFile ARG` A file with a list of packages. Works just as `-f`, but multiple values can also be separated by newline, not just by comma. `-f` and `--fetchFile` can be combined.

`--remoteURL ARG` URL of the remote Poseidon server (default: `"https://c107-224.cloud.gwdg.de"`)

`-u, --upgrade` overwrite outdated local package versions

`--downloadAll` download all packages the server is offering

It works with

```
trident fetch -d ... -d ... \
  -f "*package_title_1*,*package_title_2*,*package_title_3*,group_name,<Individual1>" \
  --fetchFile path/to/forgeFile
```

and the entities you want to download must be listed either in a simple string with comma-separated values (`-f/--fetchString`) or in a text file (`--fetchFile`). Entities are specified using a special syntax: Package titles are wrapped in asterisks: *package\_title* (see also the documentation of `forge` below), group names are spelled as is, and individual names are wrapped in angular brackets, like `<Individual1>`. Fetch will figure out which packages need to be downloaded to include all specified entities. `--downloadAll` causes fetch to ignore `-f` and download all packages from the server. The downloaded packages are added in the first (!) `-d` directory, but downloads are only performed if the respective packages are not already present in an up-to-date version in any of the `-d` dirs.

Note that `trident fetch` makes most sense in combination with `trident list --remote`: First one can inspect what is available on the server, then one can create a custom fetch command.

`fetch` also has the optional arguments `--remote https://...` to name an alternative poseidon server. The default points to the [DAG server](#).

To overwrite outdated package versions with `fetch`, the `-u/--upgrade` flag has to be set. Note that many file systems do not offer a way to recover overwritten files. So be careful with this switch.

**0.1.3.3 Forge command** `forge` creates new poseidon packages by extracting and merging packages, populations and individuals from your poseidon repositories.

[Click here for command line details](#)

```
Usage: trident forge [-d|--baseDir DIR]
                [(-r|--inFormat ARG) (-g|--genoFile ARG) (-s|--snpFile ARG)
                (-i|--indFile ARG) [--snpSet ARG]]
                [--forgeFile ARG | (-f|--forgeString ARG)]
                [--selectSnps ARG] [--intersect] [--outFormat ARG]
```

```

158         [--minimal] [--onlyGeno] (-o|--outPackagePath ARG)
159         [-n|--outPackageName ARG] [-w|--warnings] [--no-extract]
160     Select packages, groups or individuals and create a new Poseidon package from
161     them
162
163     Available options:
164     -h,--help                Show this help text
165     -d,--baseDir DIR         a base directory to search for Poseidon Packages
166                             (could be a Poseidon repository)
167     -r,--inFormat ARG       the format of the input genotype data: EIGENSTRAT or
168                             PLINK
169     -g,--genoFile ARG       the input geno file path
170     -s,--snpFile ARG        the input snp file path
171     -i,--indFile ARG        the input ind file path
172     --snpSet ARG            the snpSet of the new package: 1240K, HumanOrigins or
173                             Other. Default: Other
174     --forgeFile ARG         A file with a list of packages, groups or individual
175                             samples. Works just as -f, but multiple values can
176                             also be separated by newline, not just by comma.
177                             Empty lines are ignored and comments start with "#",
178                             so everything after "#" is ignored in one line.
179     -f,--forgeString ARG    List of packages, groups or individual samples to be
180                             combined in the output package. Packages follow the
181                             syntax *package_title*, populations/groups are simply
182                             group_id and individuals <individual_id>. You can
183                             combine multiple values with comma, so for example:
184                             "*package_1*, <individual_1>, <individual_2>,
185                             group_1". Duplicates are treated as one entry.
186                             Negative selection is possible by prepending "-" to
187                             the entity you want to exclude (e.g. "*package_1*,
188                             -<individual_1>, -group_1"). forge will apply
189                             excludes and includes in order. If the first entity
190                             is negative, then forge will assume you want to merge
191                             all individuals in the packages found in the baseDirs
192                             (except the ones explicitly excluded) before the
193                             exclude entities are applied. An empty forgeString
194                             will therefore merge all available individuals.
195     --selectSnps ARG        To extract specific SNPs during this forge operation,
196                             provide a Snp file. Can be either Eigenstrat (file
197                             ending must be '.snp') or Plink (file ending must be
198                             '.bim'). When this option is set, the output package
199                             will have exactly the SNPs listed in this file. Any
200                             SNP not listed in the file will be excluded. If
201                             option '--intersect' is also set, only the SNPs
202                             overlapping between the SNP file and the forged

```

203 packages are output.

204 `--intersect` Whether to output the intersection of the genotype  
 205 files to be forged. The default (if this option is  
 206 not set) is to output the union of all SNPs, with  
 207 genotypes defined as missing in those packages which  
 208 do not have a SNP that is present in another package.  
 209 With this option set, the forged dataset will  
 210 typically have fewer SNPs, but less missingness.

211 `--outFormat ARG` the format of the output genotype data: EIGENSTRAT or  
 212 PLINK. Default: PLINK

213 `--minimal` should only a minimal output package be created?

214 `--onlyGeno` should only the resulting genotype data be returned?  
 215 This means the output will not be a Poseidon package

216 `-o,--outPackagePath ARG` the output package directory path

217 `-n,--outPackageName ARG` the output package name - this is optional: If no  
 218 name is provided, then the package name defaults to  
 219 the basename of the (mandatory) `--outPackagePath`  
 220 argument

221 `-w,--warnings` Show all warnings for merging genotype data

222 `--no-extract` Skip the selection step in forge. This will result in  
 223 outputting all individuals in the relevant packages,  
 224 and hence a superset of the requested  
 225 individuals/groups. It may result in better  
 226 performance in cases where one wants to forge entire  
 227 packages or almost entire packages. Note that this  
 228 will also ignore any ordering in the output  
 229 groups/individuals. With this option active,  
 230 individuals from the relevant packages will just be  
 231 written in the order that they appear in the original  
 232 packages.

233 `forge` can be used with

```
234 trident forge -d ... -d ... \
235   -f "*package_name*, group_id, <individual_id>" \
236   --forgeFile path/to/forgeFile \
237   -o path/to/new_package_name
```

238 where the entities (packages, groups/populations, individuals/samples) you want in the output package can  
 239 be denoted either as as simple string with comma-separated values (`-f/--forgeString`) or in a text file  
 240 (`--forgeFile`).

241 Including one or multiple Poseidon packages with `-d` is not the only way to include data for a forge operation. It  
 242 is also possible to include unpackaged genotype data directly with `-r + -g + -s + -i (+ --snpSet)`. This  
 243 makes the following example possible, where we merge data from one Poseidon package and two genotype  
 244 datasets.

```
245 trident forge \
```

```

246 -d 2017_GonzalesFortesCurrentBiology \
247 -r PLINK \
248 -g 2017_HaberAJHG/2017_HaberAJHG.bed \
249 -s 2017_HaberAJHG/2017_HaberAJHG.bim \
250 -i 2017_HaberAJHG/2017_HaberAJHG.fam \
251 -r PLINK \
252 -g 2018_VeeramahPNAS/2018_VeeramahPNAS.bed \
253 -i 2018_VeeramahPNAS/2018_VeeramahPNAS.fam \
254 -s 2018_VeeramahPNAS/2018_VeeramahPNAS.bim \
255 -f "<STR241.SG>,<ERS1790729.SG>,Iberia_HG.SG" \
256 -o testpackage \
257 --onlyGeno

```

258 **0.1.3.3.1 The forge selection language** Entities in the `--forgeString` or the `--forgeFile` have to be  
259 marked in a certain way:

- 260 • Each package is surrounded by `*`, so if you want all individuals of `2019_Jeong_InnerEurasia` in the  
261 output package you would add `*2019_Jeong_InnerEurasia*` to the list.
- 262 • Groups/populations are not specially marked. So to get all individuals of the group `Swiss_Roman_period`,  
263 you would simply add `Swiss_Roman_period`.
- 264 • Individuals/samples are surrounded by `<` and `>`, so `ALA026` becomes `<ALA026>`.

265 Do not forget to wrap the `forgeString` in quotes.

266 You can either use `-f/--forgeString` or `--forgeFile`. In the file each line is treated as a separate `forgeString`,  
267 empty lines are ignored and `#`s start comments. So this is a valid `forgeFile`:

```

268 # Packages
269 *package1*, *package2*
270
271 # Groups and individuals from other packages beyond package1 and package2
272 group1, <individual1>, group2, <individual2>, <individual3>
273
274 # group2 has two outlier individuals that should be ignored
275 -<bad_individual1> # This one has very low coverage
276 -<bad_individual2> # This one is from a different time period

```

277 By prepending `-` to the bad individuals, we can exclude them from the forged package. `forge` fig-  
278 ures out the final list of samples to include by executing all `forge`-entities in order. So an entity list  
279 `*PackageA*, -<Individual1>, GroupA` may result in a different outcome than `*PackageA*, GroupA, -<Individual1>`,  
280 depending on whether `<Individual1>` belongs to `GroupA` or not. If the `forge` entity list starts with a negative  
281 entity, or if the entity list is empty, `forge` will implicitly assume you want to include all individuals in all  
282 packages found in the `baseDirs` (except the ones explicitly excluded, of course). An empty `forgeString` will  
283 therefore merge all available individuals.

284 **0.1.3.3.2 Other options** Just as for `init` the output package of `forge` is created as a new directory `-o`.  
285 The title can also be explicitly defined with `-n`.

286 `--minimal` allows for the creation of a minimal output package without `.bib` and `.janno`. This might be

287 especially useful for data analysis pipelines, where only the genotype data is required. Even more basic output  
288 comes with `--onlyGeno`, which means that only the genotype data is returned without any Poseidon package.

289 `forge` has a an optional flag `--intersect`, that defines, if the genotype data from different packages should  
290 be merged with an **union** or an **intersect** operation. The default (if this option is not set) is to output the  
291 union of all SNPs, with genotypes defined as missing in samples from packages which do not have a SNP that is  
292 present in another package. With this option set, on the other hand, the forged dataset will typically have fewer  
293 SNPs, but less missingness.

294 `--intersect` also influences the automatic determination of the `snpSet` field in the POSEIDON.yml file for the  
295 resulting package. If the `snpSets` of all input packages are identical, then the resulting package will just inherit  
296 this configuration. Otherwise `forge` applies the following pairwise merging logic:

Input snpSet A	Input snpSet B	<code>--intersect</code>	Ouput snpSet
Other	*	*	Other
1240K	HumanOrigins	True	HumanOrigins
1240K	HumanOrigins	False	1240K

297 `--selectSnps` allows to provide `forge` with a SNP file in EIGENSTRAT (`.snp`) or PLINK (`.bim`) format to  
298 create a package with a specific selection. When this option is set, the output package will have exactly the  
299 SNPs listed in this file. Any SNP not listed in the file will be excluded. If `--intersect` is also set, only the  
300 SNPs overlapping between the SNP file and the forged packages are output.

301 Merging genotype data across different data sources and file formats is tricky. `forge` is more verbose about  
302 potential issues, if the `-w/--warnings` flag is set.

303 **0.1.3.4 Genoconvert command** `genoconvert` converts the genotype data in a Poseidon package to a  
304 different file format. The respective entries in the POSEIDON.yml file are changed accordingly.

305 [Click here for command line details](#)

306 Usage: trident genoconvert [-d|--baseDir DIR]  
307                               [(-r|--inFormat ARG) (-g|--genoFile ARG)  
308                               (-s|--snpFile ARG) (-i|--indFile ARG)  
309                               [--snpSet ARG]] --outFormat ARG [--onlyGeno]  
310                               [--removeOld]

311 Convert the genotype data in a Poseidon package to a different file format

312 Available options:

314	<code>-h,--help</code>	Show this help text
315	<code>-d,--baseDir DIR</code>	a base directory to search for Poseidon Packages (could be a Poseidon repository)
316		
317	<code>-r,--inFormat ARG</code>	the format of the input genotype data: EIGENSTRAT or PLINK
318		
319	<code>-g,--genoFile ARG</code>	the input geno file path
320	<code>-s,--snpFile ARG</code>	the input snp file path
321	<code>-i,--indFile ARG</code>	the input ind file path
322	<code>--snpSet ARG</code>	the snpSet of the new package: 1240K, HumanOrigins or

```

323         Other. Default: Other
324     --outFormat ARG         the format of the output genotype data: EIGENSTRAT or
325                             PLINK.
326     --onlyGeno              should only the resulting genotype data be returned?
327                             This means the output will not be a Poseidon package
328     --removeOld             Remove the old genotype files when creating the new
329                             ones
330
330 With the default setting
331
331 trident genoconvert -d ... -d ... --outFormat EIGENSTRAT|PLINK
332
332 all packages in -d will be converted to the desired --outFormat (either EIGENSTRAT or PLINK), if the data is
333 not already in this format. This includes updating the respective POSEIDON.yml files.
334
334 Instead of -d to change Poseidon packages, the combination -r + -g + -s + -i (+ --snpSet) allows to
335 directly convert genotype data that is not wrapped in a Poseidon package. See this example:
336
336 trident genoconvert \
337     -r PLINK \
338     -g 2018_Mittnik_Baltic/Mittnik_Baltic.bed \
339     -s 2018_Mittnik_Baltic/Mittnik_Baltic.bim \
340     -i 2018_Mittnik_Baltic/Mittnik_Baltic.fam \
341     --outFormat EIGENSTRAT
342
342 The “old” data is not deleted, but kept around. That means conversion will result in a package with both PLINK
343 and EIGENSTRAT data, but only one is linked in the POSEIDON.yml file, and that is what will be used by
344 trident. To delete the old data in the conversion you can add the --removeOld flag.
345
345 Remember that the POSEIDON.yml file can also be edited by hand if you want to replace the genotype data in
346 a package.
347
347 0.1.3.5 Update command update automatically updates POSEIDON.yml files of one or multiple packages
348 if the packages were changed.
349
349 Click here for command line details
350
350 Usage: trident update (-d|--baseDir DIR) [--poseidonVersion ARG]
351         [--ignorePoseidonVersion] [--versionComponent ARG]
352         [--noChecksumUpdate] [--newContributors ARG]
353         [--logText ARG] [--force]
354
354 Update POSEIDON.yml files automatically
355
356 Available options:
357     -h,--help                Show this help text
358     -d,--baseDir DIR         a base directory to search for Poseidon Packages
359                             (could be a Poseidon repository)
360     --poseidonVersion ARG    Poseidon version the packages should be updated to:
361                             e.g. "2.5.3" (default: Nothing)
362     --ignorePoseidonVersion  Read packages even if their poseidonVersion is not
363                             compatible with the trident version. The assumption

```

```

364         is, that the package is already structurally adjusted
365         to the trident version and only the version number is
366         lagging behind.
367     --versionComponent ARG    Part of the package version number in the
368                               POSEIDON.yml file that should be updated: Major,
369                               Minor or Patch (see
370                               https://semver.org) (default: Patch)
371     --noChecksumUpdate        Should update of checksums in the POSEIDON.yml file
372                               be skipped
373     --ignoreGeno               ignore SNP and GenoFile
374     --newContributors ARG      Contributors to add to the POSEIDON.yml file in the
375                               form "[Firstname Lastname](Email address);..."
376     --logText ARG              Log text for this version jump in the CHANGELOG
377                               file (default: "not specified")
378     --force                    Normally the POSEIDON.yml files are only changed if
379                               the poseidonVersion is adjusted or any of the
380                               checksums change. With --force a package version
381                               update can be triggered even if this is not the case.

```

382 It can be called with a lot of optional arguments

```

383 trident update -d ... -d ... \
384     --poseidonVersion "X.X.X" \
385     --versionComponent Major/Minor/Patch \
386     --noChecksumUpdate
387     --ignoreGeno
388     --newContributors "[Firstname Lastname](Email address);..."
389     --logText "short description of the update"
390     --force

```

391 By default `update` will not edit a package's POSEIDON.yml file, even when arguments like `--versionComponent`,  
392 `--newContributors` or `--logText` are explicitly set. This default exists to run the function on a large set of  
393 packages where only few of them were edited and need an active update. A package will only be modified by  
394 `update` if either

- 395 • any of the files with checksums (e.g. the genotype data) in it were modified,
- 396 • the `--poseidonVersion` argument differs from the `poseidonVersion` in the package's POSEIDON.yml  
397 file
- 398 • or the `--force` flag was set in `update`.

399 If any of these applies to a package in the search directory (`--baseDir/-d`), it will be updated. This includes  
400 the following steps:

- 401 • If `--poseidonVersion` is different from the `poseidonVersion` field in the package, then that will be  
402 updated.
- 403 • The `packageVersion` will be incremented. If `--versionComponent` is not set, then it falls back to `Patch`,  
404 so a change in the last position of the three digit version number. `Minor` increments the middle, and `Major`  
405 the first position (see [semantic versioning](#)).
- 406 • The `lastModified` field will be updated to the current day (based on your computer's system time).

- The contributors in `--newContributors` will be added to the `contributor` field if they're not there already.
- If any checksums changed, then they will be updated. If certain checksums are not set yet, then they will be added. The checksum update can be skipped with `--noChecksumUpdate` or partially skipped for the genotype data with `--ignoreGeno`.
- The CHANGELOG.md file will be updated with a new row for the new version and the text in `--logText` (default: "not specified"), which will be appended as the first line of the file. If no CHANGELOG.md file exists, then it will be created and referenced in the POSEIDON.yml file.

:heavy\_exclamation\_mark: As `update` reads and rewrites POSEIDON.yml files, it may change their inner order, layout or even content (e.g. if they have fields which are not in the [Poseidon package definition](#)). Create a backup of the POSEIDON.yml file before running `update` if you are uncertain.

#### 0.1.4 Inspection commands

**0.1.4.1 List command** `list` lists packages, groups and individuals of the datasets you use, or of the packages available on the server.

[Click here for command line details](#)

```
Usage: trident list ((-d|--baseDir DIR) | --remote [--remoteURL ARG])
                (--packages | --groups | --individuals
                [-j|--jannoColumn JANNO_HEADER]) [--raw]
```

List packages, groups or individuals from local or remote Poseidon repositories

Available options:

<code>-h,--help</code>	Show this help text
<code>-d,--baseDir DIR</code>	a base directory to search for Poseidon Packages (could be a Poseidon repository)
<code>--remote</code>	list packages from a remote server instead the local file system
<code>--remoteURL ARG</code>	URL of the remote Poseidon server (default: "https://c107-224.cloud.gwdg.de")
<code>--packages</code>	list all packages
<code>--groups</code>	list all groups, ignoring any group names after the first as specified in the Janno-file
<code>--individuals</code>	list individuals
<code>-j,--jannoColumn JANNO_HEADER</code>	list additional fields from the janno files, using the Janno column heading name, such as Country, Site, Date_C14_Uncal_BP, Endogenous, ...
<code>--raw</code>	output table as tsv without header. Useful for piping into grep or awk
<code>--ignoreGeno</code>	ignore SNP and GenoFile

To list packages from your local repositories, as seen above you can run

```
trident list -d ... -d ... --packages
```

This will yield a table like this

```

449 .-----,-----,-----,
450 |           Title           |   Date   | Nr Individuals |
451 :=====:=====:=====:
452 | 2015_1000Genomes_1240K_haploid_pulldown | 2020-08-10 | 2535          |
453 | 2016_Mallick_SGDP1240K_diploid_pulldown | 2020-08-10 | 280           |
454 | 2018_BostonDatashare_modern_published   | 2020-08-10 | 2772          |
455 | ...                                     | ...       |               |
456 '-----'-----'-----'

```

457 so a nicely formatted table of all packages, their last update and the number of individuals in it.

458 To view packages on the remote server, instead of using directories to specify the locations of repositories on  
459 your system, you can use `--remote` to show packages on the remote server. For example

```
460 trident list --packages --remote
```

461 will result in a view of all published packages in our public online repository.

462 You can also list groups, as defined in the third column of EIGENSTRAT `.ind` files (or the first column of a  
463 PLINK `.fam` file), and individuals:

```
464 trident list -d ... -d ... --groups
```

```
465 trident list -d ... -d ... --individuals
```

466 The `--individuals` flag also provides a way to immediately access information from the `.janno` files on the  
467 command line. This works with the `-j/--jannoColumn` option. For example adding `--jannoColumn Country`  
468 `--jannoColumn Date_C14_Uncal_BP` to the commands above will add the `Country` and the `Date_C14_Uncal_BP`  
469 columns to the respective output tables.

470 Note that if you want a less fancy table, for example because you want to load this into Excel, or pipe into  
471 another command that cannot deal with the neat table layout, you can use the `--raw` option to output that  
472 table as a simple tab-delimited stream.

473 **0.1.4.2 Summarise command** `summarise` prints some general summary statistics for a given poseidon  
474 dataset taken from the `.janno` files.

475 [Click here for command line details](#)

```
476 Usage: trident summarise (-d|--baseDir DIR) [--raw]
```

```
477   Get an overview over the content of one or multiple Poseidon packages
```

```
478
479 Available options:
```

```
480   -h,--help           Show this help text
```

```
481   -d,--baseDir DIR    a base directory to search for Poseidon Packages
482                       (could be a Poseidon repository)
```

```
483   --raw               output table as tsv without header. Useful for piping
484                       into grep or awk
```

485 You can run it with

```
486 trident summarise -d ... -d ...
```

487 which will show you context information like – among others – the number of individuals in the dataset, their  
488 sex distribution, the mean age of the samples (for ancient data) or the mean coverage on the 1240K SNP array  
489 in a table. **summarise** depends on complete .janno files and will silently ignore missing information for some  
490 statistics.

491 You can use the **--raw** option to output the summary table in a simple, tab-delimited layout.

492 **0.1.4.3 Survey command** **survey** tries to indicate package completeness (mostly focused on .janno files)  
493 for poseidon datasets.

494 [Click here for command line details](#)

495 Usage: trident survey (-d|--baseDir DIR) [--raw]

496 Survey the degree of context information completeness for Poseidon packages

497  
498 Available options:  
499 -h,--help Show this help text  
500 -d,--baseDir DIR a base directory to search for Poseidon Packages  
501 (could be a Poseidon repository)  
502 --raw output table as tsv without header. Useful for piping  
503 into grep or awk

504 Running

505 trident survey -d ... -d ...

506 will yield a table with one row for each package. See **trident survey -h** for a legend which cell of this table  
507 means what.

508 Again you can use the **--raw** option to output the survey table in a tab-delimited format.

509 **0.1.4.4 Validate command** **validate** checks poseidon datasets for structural correctness.

510 [Click here for command line details](#)

511 Usage: trident validate (-d|--baseDir DIR) [--verbose]

512 Check one or multiple Poseidon packages for structural correctness

513  
514 Available options:  
515 -h,--help Show this help text  
516 -d,--baseDir DIR a base directory to search for Poseidon Packages  
517 (could be a Poseidon repository)  
518 --verbose print more output to the command line  
519 --ignoreGeno ignore SNP and GenoFile  
520 --noExitCode do not produce an explicit exit code

521 You can run it with

522 trident validate -d ... -d ...

523 and it will either report a success (**Validation passed**) or failure with specific error messages to simplify fixing  
524 the issues.

525 **validate** tries to ensure that each package in the dataset adheres to the [schema definition](#). Here is a list of  
526 what is checked:

- 527 • Presence of the necessary files
- 528 • Full structural correctness of .bib and .janno file
- 529 • Superficial correctness of genotype data files. A full check would be too computationally expensive
- 530 • Correspondence of BibTeX keys in .bib and .janno
- 531 • Correspondence of individual and group IDs in .janno and genotype data files

532 In fact much of this validation already runs as part of the general package reading pipeline invoked for many  
533 trident subcommands (e.g. **forge**). **validate** is meant to be more thorough, though, and will explicitly fail if  
534 even a single package is broken.

### 535 **0.1.5 Analysis commands**

536 All analysis commands (e.g. **trident fstats**) have been moved from trident to the analysis tool **xerxes**.
