20	1	Poseidon package repositories	
21	Tr	ident generally requires Poseidon "packages" to work with (since version 0.28.0 it also supports direct	t
22	int	teraction with "unpackaged" genotype data – see p below). Most trident subcommands therefore have	a
23	cei	ntral parameter, calledbaseDir or simply -d to specify one or more base directories to look for package	s.
24	Fo	or example, if all Poseidon packages live inside a repository at /path/to/poseidon/packages you would	d
25	sin	nply say trident <subcommand> -d /path/to/poseidon/dirs/ and trident would automatically search</subcommand>	h
26	all	subdirectories inside of the repository for valid poseidon packages (as identified by valid POSEIDON.yml	L
27	file	es).	
28	Yo	ou can arrange a poseidon repository in a hierarchical way. For example:	
29	/p	eath/to/poseidon/packages	
30		/modern	
31		/2019_poseidon_package1	
32		/2019 poseidon package2	

```
/ancient
33
            /...
34
            /...
35
        /Reference_Genomes
            /...
37
            /...
38
       /Archaic_Humans
            /...
40
            /...
41
   You can use this structure to select only the level of packages you're interested in, and you can make use of the
42
   fact that -d can be given multiple times.
43
   Let's use the list command to list all packages in the modern and Reference_Genomes:
   trident list -d /path/to/poseidon/packages/modern \
     -d /path/to/poseidon/packages/ReferenceGenomes --packages
46
   2
        Analysing your own dataset outside of the main repository
   Being able to specify one or multiple repositories is often not enough, as you may have your own data to
   co-analyse with the main repository. This is easy to do, as you simply need to provide your own genotype data
49
   as yet another poseidon package to be added to your trident list command. For example, let's say you have
50
   genotype data in EIGENSTRAT format (trident supports EIGENSTRAT and PLINK as formats.):
   ~/my_project/my_project.geno
   ~/my_project/my_project.snp
53
   ~/my_project/my_project.ind
   then you can make that to a skeleton Poseidon package with the init command. You can also do it manually
55
   by simply adding a POSEIDON.yml file, with for example the following content:
   poseidonVersion: 2.5.0
57
   title: My_awesome_project
58
   description: Unpublished genetic data from my awesome project
   contributor:
     - name: Stephan Schiffels
61
       email: schiffels@institute.org
   packageVersion: 0.1.0
63
   lastModified: 2020-10-07
64
   genotypeData:
     format: EIGENSTRAT
66
     genoFile: my_project.geno
67
     snpFile: my_project.snp
     indFile: my_project.ind
   jannoFile: my_project.janno
70
   bibFile: sources.bib
```

Two remarks: 1) all file paths are considered relative to the directory in which POSEIDON.yml resides. Here I

```
assume that you put this file into the same directory as the three genotype files. 2) Besides the genotype data
files there are two (technically optional) files referenced by this example POSEIDON.yml file: sources.bib
and my_project.janno. Of course you can add them manually - init automatically creates empty dummy
versions.

Once you have set up your own "Poseidon" package (which is really only a skeleton so far), you can add it to
your trident analysis, by simply adding your project directory to the command using -d:

trident list -d /path/to/poseidon/packages/modern \
-d /path/to/poseidon/packages/ReferenceGenomes
-d ~/my_project --packages
```

3 Package creation and manipulation commands

3.1 Init command

init creates a new, valid poseidon package from genotype data files. It adds a valid POSEIDON.yml file, a dummy .janno file for context information and an empty .bib file for literature references.

5 Click here for command line details

```
Usage: trident init ((-p|--genoOne ARG) | --inFormat ARG --genoFile ARG --snpFile ARG --indFile ARG) [--snpSet ARG]

(-o|--outPackagePath ARG) [-n|--outPackageName ARG]

[--minimal]
```

Create a new Poseidon package from genotype data

93 Available options:

91

```
-h,--help
                                Show this help text
                                one of the input genotype data files. Expects .bed or
      -p,--genoOne ARG
95
                                .bim or .fam for PLINK and .geno or .snp or .ind for
                                EIGENSTRAT. The other files must be in the same
97
                                directory and must have the same base name
                                the format of the input genotype data: EIGENSTRAT or
      --inFormat ARG
99
                                PLINK (only necessary for data input with --genoFile
100
                                + --snpFile + --indFile)
101
      --genoFile ARG
                                the input geno file path
102
                                the input snp file path
      --snpFile ARG
103
      --indFile ARG
                                the input ind file path
104
      --snpSet ARG
                                the snpSet of the new package: 1240K, HumanOrigins or
105
                                Other. Default: Other
106
      -o, -- outPackagePath ARG
                                the output package directory path
107
      -n,--outPackageName ARG
                                the output package name - this is optional: If no
108
                                name is provided, then the package name defaults to
109
                                the basename of the (mandatory) --outPackagePath
110
                                argument
111
                                should only a minimal output package be created?
      --minimal
112
```

The command

```
trident init \
      --inFormat EIGENSTRAT/PLINK \
115
      --genoFile path/to/geno_file \
116
      --snpFile path/to/snp_file \
117
      --indFile path/to/ind_file \
118
      --snpSet 1240K|HumanOrigins|Other \
119
      -o path/to/new_package_name
120
   requires the format ( --inFormat ) of your input data (either EIGENSTRAT or PLINK), the paths to the
121
    respective files ( --genoFile , --snpFile , --indFile ), and optionally the "shape" of these files ( --snpSet ),
    so if they cover the 1240K, the HumanOrigins or an Other SNP set. A simpler interface added in trident
123
   0.29.0 is available with -p (+ --snpSet).
124
```

	EIGENSTRAT	PLINK
genoFile	.geno	.bed
$\operatorname{snpFile}$	$.\mathrm{snp}$.bim
$\operatorname{indFile}$.ind	.fam

The output package of init is created as a new directory -o, which should not already exist, and gets the package title corresponding to the basename of -o. You can also set the title explicitly with -n. The --minimal flag causes init to create a minimal package with a very basic POSEIDON.yml and no .bib and .janno files.

129 3.2 Fetch command

130 fetch allows to download poseidon packages from a remote poseidon server.

Click here for command line details

Download data from a remote Poseidon repository

```
Available options:
```

137

```
-h,--help
                                Show this help text
139
     -d,--baseDir DIR
                                a base directory to search for Poseidon Packages
140
                                (could be a Poseidon repository)
141
     --downloadAll
                                download all packages the server is offering
142
                                A file with a list of packages. Works just as -f, but
     --fetchFile ARG
                                multiple values can also be separated by newline, not
144
                                just by comma. -f and --fetchFile can be combined.
145
     -f,--fetchString ARG
                                List of packages to be downloaded from the remote
146
                                server. Package names should be wrapped in asterisks:
147
                                *package_title*. You can combine multiple values with
148
                                comma, so for example: "*package_1*, *package_2*,
149
```

```
*package_3*". fetchString uses the same parser as
150
                                   forgeString, but does not allow excludes. If groups
151
                                   or individuals are specified, then packages which
152
                                   include these groups or individuals are included in
153
                                   the download.
154
      --remoteURL ARG
                                   URL of the remote Poseidon server
155
                                   (default: "https://c107-224.cloud.gwdg.de")
156
      -u,--upgrade
                                   overwrite outdated local package versions
157
   It works with
    trident fetch -d ... -d ... \
159
      -f "*package_title_1*,*package_title_2*,*package_title_3*,group_name,<Individual1>" \
160
      --fetchFile path/to/forgeFile
161
    and the entities you want to download must be listed either in one or more simple strings with comma-separated
162
    values, which can be passed via one or multiple options -f / --fetchString, or in one or more text files
163
   (--fetchFile). Entities are then combined from these sources. Entities are specified using a special syntax:
164
    Package titles are wrapped in asterisks: package title (see also the documentation of forge below), group
165
    names are spelled as is, and individual names are wrapped in angular brackets, liks <Individual1>. Fetch will
166
    figure out which packages need to be downloaded to include all specified entities. --downloadAll, which can be
167
    given instead of -f and --fetchFile, causes fetch to download all packages from the server. The downloaded
168
    packages are added in the first (!) -d directory (which gets created if it doesn't exist), but downloads are only
169
    performed if the respective packages are not already present in an up-to-date version in any of the -d dirs.
170
   Note that trident fetch makes most sense in combination with trident list --remote: First one can
171
    inspect what is available on the server, then one can create a custom fetch command.
172
    fetch also has the optional arguments --remote https:://..." do name an alternative poseidon server.
173
    The default points to the DAG server.
174
    To overwrite outdated package versions with fetch, the -u / --upgrade flag has to be set. Note that many
```

3.3 Forge command

176

177

190

forge creates new poseidon packages by extracting and merging packages, populations and individuals from your poseidon repositories.

180 Click here for command line details

```
Usage: trident forge ((-d|--baseDir DIR) |
181
                            ((-p|--genoOne ARG) | --inFormat ARG --genoFile ARG
182
                              --snpFile ARG --indFile ARG) [--snpSet ARG])
                          [--forgeFile ARG | (-f|--forgeString ARG)]
184
                          [--selectSnps ARG] [--intersect] [--outFormat ARG]
185
                          [--minimal] [--onlyGeno] (-o|--outPackagePath ARG)
186
                          [-n|--outPackageName ARG] [--no-extract]
187
     Select packages, groups or individuals and create a new Poseidon package from
188
     them
189
```

file systems do not offer a way to recover overwritten files. So be careful with this switch.

191	Available options:	
192	-h,help	Show this help text
193	-d,baseDir DIR	a base directory to search for Poseidon Packages
194		(could be a Poseidon repository)
195	-p,genoOne ARG	one of the input genotype data files. Expects .bed or
196		.bim or .fam for PLINK and .geno or .snp or .ind for
197		EIGENSTRAT. The other files must be in the same
198		directory and must have the same base name
199	inFormat ARG	the format of the input genotype data: EIGENSTRAT or
200		PLINK (only necessary for data input withgenoFile
201		+snpFile +indFile)
202	genoFile ARG	the input geno file path
203	snpFile ARG	the input snp file path
204	indFile ARG	the input ind file path
205	snpSet ARG	the snpSet of the new package: 1240K, HumanOrigins or
206		Other. Default: Other
207	forgeFile ARG	A file with a list of packages, groups or individual
208		samples. Works just as -f, but multiple values can
209		also be separated by newline, not just by comma.
210		Empty lines are ignored and comments start with "#",
211		so everything after "#" is ignored in one line.
212		Multiple instances of -f andforgeFile can be
213		given. They will be evaluated according to their
214		input order on the command line.
215	-f,forgeString ARG	List of packages, groups or individual samples to be
216		combined in the output package. Packages follow the
217		<pre>syntax *package_title*, populations/groups are simply</pre>
218		group_id and individuals <individual_id>. You can</individual_id>
219		combine multiple values with comma, so for example:
220		<pre>"*package_1*, <individual_1>, <individual_2>,</individual_2></individual_1></pre>
221		group_1". Duplicates are treated as one entry.
222		Negative selection is possible by prepending "-" to
223		the entity you want to exclude (e.g. "*package_1*,
224		- <individual_1>, -group_1"). forge will apply</individual_1>
225		excludes and includes in order. If the first entity
226		is negative, then forge will assume you want to merge
227		all individuals in the packages found in the baseDirs (except the ones explicitly excluded) before the
228		exclude entities are applied. An empty forgeString
229		(and noforgeFile) will therefore merge all
230		available individuals.
231	selectSnps ARG	To extract specific SNPs during this forge operation,
232	porocopupo nito	provide a Snp file. Can be either Eigenstrat (file
234		ending must be '.snp') or Plink (file ending must be
235		'.bim'). When this option is set, the output package
233		/. "mon only opolon is sou, one output package

```
will have exactly the SNPs listed in this file. Any
236
                                 SNP not listed in the file will be excluded. If
237
                                 option '--intersect' is also set, only the SNPs
238
                                 overlapping between the SNP file and the forged
239
                                 packages are output.
240
      --intersect
                                 Whether to output the intersection of the genotype
241
                                 files to be forged. The default (if this option is
242
                                 not set) is to output the union of all SNPs, with
243
                                 genotypes defined as missing in those packages which
244
                                 do not have a SNP that is present in another package.
245
                                 With this option set, the forged dataset will
246
                                 typically have fewer SNPs, but less missingness.
247
      --outFormat ARG
                                 the format of the output genotype data: EIGENSTRAT or
248
                                 PLINK. Default: PLINK
249
      --minimal
                                 should only a minimal output package be created?
250
                                 should only the resulting genotype data be returned?
      --onlyGeno
251
                                 This means the output will not be a Poseidon package
252
      -o, -- outPackagePath ARG
                                 the output package directory path
253
      -n,--outPackageName ARG
                                 the output package name - this is optional: If no
254
                                 name is provided, then the package name defaults to
255
                                 the basename of the (mandatory) --outPackagePath
256
                                 argument
      --no-extract
                                 Skip the selection step in forge. This will result in
258
                                 outputting all individuals in the relevant packages,
259
                                 and hence a superset of the requested
                                 individuals/groups. It may result in better
261
                                 performance in cases where one wants to forge entire
262
                                 packages or almost entire packages. Note that this
263
                                 will also ignore any ordering in the output
                                 groups/individuals. With this option active,
265
                                 individuals from the relevant packages will just be
                                 written in the order that they appear in the original
267
                                 packages.
268
    forge can be used with
    trident forge -d ... -d ... \
270
      -f "*package_name*, group_id, <individual_id>" \
271
      --forgeFile path/to/forgeFile \
272
      -o path/to/new_package_name
273
   where the entities (packages, groups/populations, individuals/samples) you want in the output package can be
   denoted either as one or more simple strings with comma-separated values via one or more ( -f / --forgeString )
275
   options, or in one or more text files ( --forgeFile ). Because the order in which inclusions and exclusions
276
   are given, the order strictly follows the order as these strings are given via options -f / --forgeString and
277
    --forgeFile.
```

```
--inFormat + --genoFile + --snpFile + --indFile (+ --snpSet) . This makes the following example
281
   possible, where we merge data from one Poseidon package and two genotype datasets to get a new EIGENSTRAT
282
   dataset.
283
    trident forge \
284
      -d 2017_GonzalesFortesCurrentBiology \
      -p 2018_VeeramahPNAS/2018_VeeramahPNAS.fam \
286
      --inFormat PLINK \
287
      --genoFile 2017_HaberAJHG/2017_HaberAJHG.bed \
      --snpFile 2017_HaberAJHG/2017_HaberAJHG.bim \
289
      --indFile 2017_HaberAJHG/2017_HaberAJHG.fam \
290
      -f "<STR241.SG>,<ERS1790729.SG>,Iberia_HG.SG" \
291
      -o testpackage \
      --outFormat EIGENSTRAT \
293
      --onlyGeno
           The forge selection language
295
   Entities in the --forgeString or the --forgeFile have to be marked in a certain way:
296
      • Each package is surrounded by *, so if you want all individuals of 2019_Jeong_InnerEurasia in the
297
         output package you would add *2019_Jeong_InnerEurasia* to the list.
298
      • Groups/populations are not specially marked. So to get all individuals of the group Swiss_Roman_period,
         you would simply add Swiss_Roman_period.
300
      • Individuals/samples are surrounded by < and >, so ALA026 becomes <ALA026>.
301
   Do not forget to wrap the forgeString in quotes.
   You can use both -f / --forgeString and --forgeFile and even combine multiple of each. They are
303
   evaluated in order.
304
   In the file each line is treated as a separate forgeString, empty lines are ignored and # s start comments. So this
305
   is a valid forgeFile:
306
   # Packages
    *package1*, *package2*
308
   # Groups and individuals from other packages beyond package1 and package2
   group1, <individual1>, group2, <individual2>, <individual3>
311
312
   # group2 has two outlier individuals that should be ignored
313
   -<bad_individual1> # This one has very low coverage
314
   -<bad_individual2> # This one is from a different time period
315
   By prepending - to the bad individuals, we can exclude them from the forged package. forge fig-
316
   ures out the final list of samples to include by executing all forge-entities in order. So an entity list
317
    *PackageA*,-<Individual1>,GroupA may result in a different outcome than *PackageA*,GroupA,-<Individual1>,
318
```

operation. It is also possible to include unpackaged genotype data directly with -p (+ --snpSet) or

depending on whether <Individual1> belongs to GroupA or not. If the forge entity list starts with a negative

entity, or if the entity list is empty, forge will implicitly assume you want to include all individuals in all

319

packages found in the baseDirs (except the ones explicitly excluded, of course). An empty forgeString will therefore merge all available individuals.

3.3.2 Other options

323

348 349

350

351

352

353

Just as for init the output package of forge is created as a new directory -o. The title can also be explicitly defined with -n.

--minimal allows for the creation of a minimal output package without .bib and .janno. This might be
especially useful for data analysis pipelines, where only the genotype data is required. Even more basic output
comes with --onlyGeno, which means that only the genotype data is returned without any Poseidon package.

forge has a an optional flag —-intersect, that defines, if the genotype data from different packages should be merged with an **union** or an **intersect** operation. The default (if this option is not set) is to output the union of all SNPs, with genotypes defined as missing in samples from packages which do not have a SNP that is present in another package. With this option set, on the other hand, the forged dataset will typically have fewer SNPs, but less missingness.

--intersect also influences the automatic determination of the snpSet field in the POSEIDON.yml file for the resulting package. If the snpSet s of all input packages are identical, then the resulting package will just inherit this configuration. Otherwise forge applies the following pairwise merging logic:

Input snpSet A	Input snpSet B	intersect	Ouput snpSet
Other	*	*	Other
1240K	HumanOrigins	True	HumanOrigins
1240K	HumanOrigins	False	$1240 \mathrm{K}$

--selectSnps allows to provide forge with a SNP file in EIGENSTRAT (.snp) or PLINK (.bim) format to create a package with a specific selection. When this option is set, the output package will have exactly the SNPs listed in this file. Any SNP not listed in the file will be excluded. If --intersect is also set, only the SNPs overlapping between the SNP file and the forged packages are output.

Merging genotype data across different data sources and file formats is tricky. forge is more verbose about potential issues, if the --logMode flag is set to VerboseLog.

343 3.3.3 Treatment of the .janno file while merging

forge merges and subsets .janno files along with the genotype data. If a package lacks a .janno file, then a
basic one will be created internally based on the information in the genotype data, and used for the output.
Missing columns across packages will be filled with n/a.

For merging two .janno files $\bf A$ and $\bf B$ the following rules apply regarding undefined, arbitrary additional columns:

- If \mathbf{A} has an additional column which is not in \mathbf{B} then empty cells in the rows imported from \mathbf{B} are filled with $\mathbf{n/a}$.
- If **A** and **B** share additional columns with identical column name, then they are treated as semantically identical units and merged accordingly.
- In the resulting .janno file, all additional columns from both **A** and **B** are sorted alphabetically and appended after the normal, specified variables.

The following example illustrates the described behaviour:

355 A.janno

Poseidon_ID	Group_Name	${\rm Genetic_Sex}$	AdditionalColumn1	AdditionalColumn2
XXX011	POP1	\mathbf{M}	A	D
XXX012	POP2	F	В	E
XXX013	POP1	M	\mathbf{C}	F

356 B.janno

Poseidon_ID	Group_Name	Genetic_Sex	AdditionalColumn3	AdditionalColumn2
YYY022	POP5	F	G	J
YYY023	POP5	F	Н	K
YYY024	POP5	M	I	L

357 A.janno + B.janno

Poseidon_ID	Group_Name	e Genetic_Sex	AdditionalColumn1	AdditionalColumn2	AdditionalColumn3
XXX011	POP1	M	A	D	n/a
XXX012	POP2	F	В	E	n/a
XXX013	POP1	M	\mathbf{C}	F	n/a
YYY022	POP5	F	n/a	J	G
YYY023	POP5	F	n/a	K	Н
YYY024	POP5	M	n/a	L	I

3.4 Genoconvert command

genoconvert converts the genotype data in a Poseidon package to a different file format. The respective entries in the POSEIDON.yml file are changed accordingly.

361 Click here for command line details

```
Usage: trident genoconvert ((-d|--baseDir DIR) |
                                  ((-p|--genoOne ARG) | --inFormat ARG --genoFile ARG
363
                                    --snpFile ARG --indFile ARG) [--snpSet ARG])
                                --outFormat ARG [--onlyGeno]
                                [-o|--outPackagePath ARG] [--removeOld]
366
     Convert the genotype data in a Poseidon package to a different file format
367
   Available options:
369
     -h,--help
                                Show this help text
370
     -d,--baseDir DIR
                                a base directory to search for Poseidon Packages
371
                                (could be a Poseidon repository)
372
     -p,--genoOne ARG
                                one of the input genotype data files. Expects .bed or
373
```

```
.bim or .fam for PLINK and .geno or .snp or .ind for
374
                                 EIGENSTRAT. The other files must be in the same
375
                                 directory and must have the same base name
376
      --inFormat ARG
                                 the format of the input genotype data: EIGENSTRAT or
377
                                 PLINK (only necessary for data input with --genoFile
378
                                 + --snpFile + --indFile)
379
      --genoFile ARG
                                 the input geno file path
380
      --snpFile ARG
                                 the input snp file path
381
      --indFile ARG
                                 the input ind file path
382
      --snpSet ARG
                                 the snpSet of the new package: 1240K, HumanOrigins or
383
                                 Other. Default: Other
384
      --outFormat ARG
                                 the format of the output genotype data: EIGENSTRAT or
385
                                 PLINK.
      --onlyGeno
                                  should only the resulting genotype data be returned?
387
                                 This means the output will not be a Poseidon package
388
      -o,--outPackagePath ARG
                                 the output package directory path - this is optional:
                                  If no path is provided, then the output is written to
390
                                 the directories where the input genotype data file
391
                                  (.bed/.geno) is stored
      --removeOld
                                 Remove the old genotype files when creating the new
393
                                  ones
394
   With the default setting
395
   trident genoconvert -d ... -d ... --outFormat EIGENSTRAT|PLINK
396
   all packages in -d will be converted to the desired --outFormat (either EIGENSTRAT or PLINK), if the data
397
   is not already in this format. This includes updating the respective POSEIDON.yml files.
398
   The "old" data is not deleted, but kept around. That means conversion can result in a package with both PLINK
300
   and EIGENSTRAT data, but only one is linked in the POSEIDON.yml file, and that is what will be used by
   trident. To delete the old data in the conversion you can add the --removeOld flag.
401
   Instead of -d to change Poseidon packages, the -p (+ --snpSet) or --inFormat + --genoFile + --snpFile + --indFi
   allow to directly convert genotype data that is not wrapped in a Poseidon package and store it to a directory
403
   given in -o . See this example:
404
    trident genoconvert \
      -p 2018_Mittnik_Baltic/Mittnik_Baltic.bed \
406
      --outFormat EIGENSTRAT
407
      -o my_directory
          Update command
   3.5
409
    update automatically harmonizes POSEIDON.yml files of one or multiple packages if the packages were
410
   changed. This is not an automatic update from one Poseidon version to the next!
411
   Click here for command line details
412
```

Usage: trident update (-d|--baseDir DIR) [--poseidonVersion ARG]

[--ignorePoseidonVersion] [--versionComponent ARG]

```
[--noChecksumUpdate] [--newContributors ARG]
415
                            [--logText ARG] [--force]
416
     Update POSEIDON.yml files automatically
417
418
   Available options:
419
      -h,--help
                                 Show this help text
420
      -d,--baseDir DIR
                                 a base directory to search for Poseidon Packages
421
                                 (could be a Poseidon repository)
422
      --poseidonVersion ARG
                                 Poseidon version the packages should be updated to:
423
                                 e.g. "2.5.3" (default: Nothing)
424
      --ignorePoseidonVersion
                                 Read packages even if their poseidonVersion is not
425
                                 compatible with the trident version. The assumption
426
                                 is, that the package is already structurally adjusted
                                 to the trident version and only the version number is
428
                                 lagging behind.
429
      --versionComponent ARG
                                 Part of the package version number in the
430
                                 POSEIDON.yml file that should be updated: Major,
431
                                 Minor or Patch (see https://semver.org)
432
                                 (default: Patch)
433
      --noChecksumUpdate
                                 Should update of checksums in the POSEIDON.yml file
434
                                 be skipped
435
                                 ignore SNP and GenoFile
      --ignoreGeno
      --newContributors ARG
                                 Contributors to add to the POSEIDON.yml file in the
437
                                 form "[Firstname Lastname](Email address);..."
438
                                 Log text for this version jump in the CHANGELOG file
      --logText ARG
439
                                 (default: "not specified")
440
      --force
                                 Normally the POSEIDON.yml files are only changed if
441
                                 the poseidonVersion is adjusted or any of the
442
                                 checksums change. With --force a package version
443
                                 update can be triggered even if this is not the case.
444
   It can be called with a lot of optional arguments
   trident update -d ... -d ... \
446
      --poseidonVersion "X.X.X" \
447
     --versionComponent Major/Minor/Patch \
448
     --noChecksumUpdate
449
     --ignoreGeno
450
     --newContributors "[Firstname Lastname] (Email address);..."
451
      --logText "short description of the update"
452
     --force
453
   By default update will not edit a package's POSEIDON.yml file, even when arguments like --versionComponent,
454
    --newContributors or --logText are explicitly set. This default exists to run the function on a large set of
455
   packages where only few of them were edited and need an active update. A package will only be modified by
456
    update if either
457
```

• any of the files with checksums (e.g. the genotype data) in it were modified,

- the --poseidonVersion argument differs from the poseidonVersion in the package's POSEIDON.yml file
- or the --force flag was set in update.

459

460

461

465

466

468

469

471

472

474

475

477

If any of these applies to a package in the search directory (--baseDir / -d), it will be updated. This includes
the following steps:

- If --poseidonVersion is different from the poseidonVersion field in the package, then that will be updated.
- The packageVersion will be incremented. If --versionComponent is not set, then it falls back to Patch, so a change in the last position of the three digit version number. Minor increments the middle, and Major the first position (see semantic versioning).
- The lastModified field will be updated to the current day (based on your computer's system time).
- The contributors in --newContributors will be added to the contributor field if they're not there already.
- If any checksums changed, then they will be updated. If certain checksums are not set yet, then they will be added. The checksum update can be skipped with --noChecksumUpdate or partially skipped for the genotype data with --ignoreGeno.
- The CHANGELOG.md file will be updated with a new row for the new version and the text in --logText (default: "not specified"), which will be appended as the first line of the file. If no CHANGELOG.md file exists, then it will be created and referenced in the POSEIDON.yml file.

278 :heavy_exclamation_mark: As update reads and rewrites POSEIDON.yml files, it may change their inner 279 order, layout or even content (e.g. if they have fields which are not in the Poseidon package definition). Create a 280 backup of the POSEIDON.yml file before running update if you are uncertain.

4 Inspection commands

482 4.1 List command

list lists packages, groups and individuals of the datasets you use, or of the packages available on the server.

Click here for command line details

```
(--packages | --groups | --individuals
486
                           [-j|--jannoColumn JANNO HEADER]) [--raw]
487
     List packages, groups or individuals from local or remote Poseidon
488
     repositories
489
490
   Available options:
491
      -h,--help
                                 Show this help text
492
      -d,--baseDir DIR
                                 a base directory to search for Poseidon Packages
493
                                 (could be a Poseidon repository)
      --remote
                                 list packages from a remote server instead the local
495
                                 file system
496
                                URL of the remote Poseidon server
497
      --remoteURL ARG
                                 (default: "https://c107-224.cloud.gwdg.de")
498
                                 list all packages
      --packages
499
```

Usage: trident list ((-d|--baseDir DIR) | --remote [--remoteURL ARG])

```
--groups
                            list all groups, ignoring any group names after the
500
                            first as specified in the Janno-file
501
                            list individuals
     --individuals
502
     -j,--jannoColumn JANNO_HEADER
503
                            list additional fields from the janno files, using
504
                            the Janno column heading name, such as Country, Site,
                            Date_C14_Uncal_BP, Endogenous, ...
                            output table as tsv without header. Useful for piping
     --raw
507
                            into grep or awk
     --ignoreGeno
                            ignore SNP and GenoFile
509
   To list packages from your local repositories, as seen above you can run
510
   trident list -d ... -d ... --packages
   This will yield a table like this
512
    1
                     Title
                                               Date
                                                       | Nr Individuals |
514
   515
   516
   517
   | 2018_BostonDatashare_modern_published
                                          | 2020-08-10 | 2772
518
                                           1 ...
519
520
   so a nicely formatted table of all packages, their last update and the number of individuals in it.
521
   To view packages on the remote server, instead of using directories to specify the locations of repositories on
522
   your system, you can use --remote to show packages on the remote server. For example
523
   trident list --packages --remote
   will result in a view of all published packages in our public online repository.
525
   You can also list groups, as defined in the third column of EIGENSTRAT ..ind files (or the first column of a
526
   PLINK .fam file), and individuals:
527
   trident list -d ... -d ... --groups
528
   trident list -d ... -d ... --individuals
529
```

The --individuals flag also provides a way to immediately access information from the .janno files on the command line. This works with the -j/--jannoColumn option. For example adding --jannoColum Country --jannoColumn Date_C14_Uncal_BP to the commands above will add the Country

and the Date_C14_Uncal_BP columns to the respective output tables.

Note that if you want a less fancy table, for example because you want to load this into Excel, or pipe into another command that cannot deal with the neat table layout, you can use the --raw option to output that table as a simple tab-delimited stream.

4.2 Summarise command

533

537

summarise prints some general summary statistics for a given poseidon dataset taken from the .janno files.

```
Click here for command line details
    Usage: trident summarise (-d|--baseDir DIR) [--raw]
540
      Get an overview over the content of one or multiple Poseidon packages
542
    Available options:
543
      -h,--help
                                  Show this help text
                                  a base directory to search for Poseidon Packages
      -d,--baseDir DIR
545
                                  (could be a Poseidon repository)
546
                                  output table as tsv without header. Useful for piping
      --raw
                                  into grep or awk
548
    You can run it with
549
    trident summarise -d ... -d ...
   which will show you context information like – among others – the number of individuals in the dataset, their
551
    sex distribution, the mean age of the samples (for ancient data) or the mean coverage on the 1240K SNP array
   in a table. summarise depends on complete janno files and will silently ignore missing information for some
553
    statistics.
554
    You can use the --raw option to output the summary table in a simple, tab-delimited layout.
    4.3
          Survey command
556
    survey tries to indicate package completeness (mostly focused on .janno files) for poseidon datasets.
557
    Click here for command line details
558
    Usage: trident survey (-d|--baseDir DIR) [--raw]
559
      Survey the degree of context information completeness for Poseidon packages
561
    Available options:
562
      -h,--help
                                  Show this help text
      -d,--baseDir DIR
                                  a base directory to search for Poseidon Packages
564
                                  (could be a Poseidon repository)
565
                                  output table as tsv without header. Useful for piping
      --raw
                                  into grep or awk
567
   Running
    trident survey -d ... -d ...
569
   will yield a table with one row for each package. See trident survey -h for a legend which cell of this table
570
    means what.
```

573 4.4 Validate command

572

validate checks poseidon datasets for structural correctness.

575 Click here for command line details

Again you can use the --raw option to output the survey table in a tab-delimited format.

```
Usage: trident validate (-d|--baseDir DIR) [--verbose]
      Check one or multiple Poseidon packages for structural correctness
577
578
   Available options:
579
      -h,--help
                                Show this help text
580
      -d,--baseDir DIR
                                 a base directory to search for Poseidon Packages
581
                                 (could be a Poseidon repository)
582
      --ignoreGeno
                                 ignore SNP and GenoFile
583
      --noExitCode
                                 do not produce an explicit exit code
584
   You can run it with
585
   trident validate -d ... -d ...
586
```

and it will either report a success (Validation passed) or failure with specific error messages to simplify fixing the issues.

validate tries to ensure that each package in the dataset adheres to the schema definition. Here is a list of what is checked:

• Presence of the necessary files

591

592

594

- Full structural correctness of .bib and .janno file
- Superficial correctness of genotype data files. A full check would be too computationally expensive
 - Correspondence of BibTeX keys in .bib and .janno
 - Correspondence of individual and group IDs in .janno and genotype data files

In fact much of this validation already runs as part of the general package reading pipeline invoked for many trident subcommands (e.g. forge). validate is meant to be more thorough, though, and will explicitly fail if even a single package is broken.

Remember to run it with --logMode VerboseLog to get more information if the output is not sufficient to debug an issue.
