6	0.1 Guide for trident	v1.1.10.2
7	0.1.1 The trident CLI	
9		ware tool structured in multiple subcommands. If you installed it properly you e by typing trident. This will show an overview of the general options and all ined in detail below.
12 13 14	[inPlinkP trident is a management	[logMode ARG] [errLength ARG] PopName ARG] (COMMAND COMMAND) and analysis tool for Poseidon packages. Report issues a/poseidon-framework/poseidon-hs/issues
15 16	Available options:	
17	-h,help	Show this help text
18	version	Show version number
19	logMode ARG	How information should be reported: NoLog, SimpleLog,
20		DefaultLog, ServerLog or VerboseLog
21		(default: DefaultLog)
22	errLength ARG	After how many characters should a potential error
23		message be truncated. "Inf" for no truncation.
24		(default: CharCount 1500)
25	inPlinkPopName ARG	Where to read the population/group name from the FAM
26		file in Plink-format. Three options are possible:
27		asFamily (default) asPhenotype asBoth.
28		
29	Package creation and manip	oulation commands:
30	init	Create a new Poseidon package from genotype data
31	fetch	Download data from a remote Poseidon repository
32	forge	Select packages, groups or individuals and create a
33		new Poseidon package from them
34	genoconvert	Convert the genotype data in a Poseidon package to a
35		different file format
36	update	Update POSEIDON.yml files automatically
37		
38	Inspection commands:	
39	list	List packages, groups or individuals from local or
40		remote Poseidon repositories
41	summarise	Get an overview over the content of one or multiple
42		Poseidon packages

```
summarize
                                  Synonym for summarise
43
                                  Survey the degree of context information completeness
     survey
44
                                  for Poseidon packages
45
                                  Check one or multiple Poseidon packages for
      validate
46
                                   structural correctness
47
   Trident allows to work directly with genotype data (see -p below), but its optimized for the interaction with
   Poseidon packages, which wrap and contextualize the data. Most trident subcommands therefore have a central
49
   parameter, called --baseDir or simply -d to specify one or more base directories to look for packages. For example,
50
   if all Poseidon packages live inside a repository at /path/to/poseidon/packages you would simply say trident
   <subcommand> -d /path/to/poseidon/dirs/ and trident would automatically search all subdirectories inside
52
   of the repository for valid Poseidon packages (as identified by valid POSEIDON.yml files).
53
   You can arrange a poseidon repository in a hierarchical way. For example:
   /path/to/poseidon/packages
55
        /modern
56
            /2019_poseidon_package1
            /2019_poseidon_package2
58
        /ancient
59
            /...
            /...
61
        /Reference_Genomes
62
            /...
            /...
64
   You can use this structure to select only the level of packages you're interested in, even individual ones, and you
   can make use of the fact that -d can be given multiple times.
66
   Being able to specify one or multiple repositories is often not enough, as you may have your own data to
67
   co-analyse with the main repository. This is easy to do, as you simply need to provide your own genotype data as
   yet another Poseidon package to be added to your trident command. For example, let's say you have genotype
69
   data in EIGENSTRAT format (trident supports EIGENSTRAT and PLINK as formats.):
70
   ~/my_project/my_project.geno
   ~/my_project/my_project.snp
72
   ~/my_project/my_project.ind
   then you can make that to a skeleton Poseidon package with the init command. You can also do it manually by
   simply adding a POSEIDON.yml file, with for example the following content:
75
   poseidonVersion: 2.5.0
   title: My_awesome_project
77
   description: Unpublished genetic data from my awesome project
78
   contributor:
      - name: Stephan Schiffels
80
        email: schiffels@institute.org
81
   packageVersion: 0.1.0
   lastModified: 2020-10-07
```

genotypeData:

```
format: EIGENSTRAT
genoFile: my_project.geno
snpFile: my_project.snp
indFile: my_project.ind
jannoFile: my_project.janno
bibFile: sources.bib
```

Two remarks: 1) all file paths are considered *relative* to the directory in which POSEIDON.yml resides. Here we assume that you put this file into the same directory as the three genotype files. 2) Besides the genotype data files there are two (technically optional) files referenced by this example POSEIDON.yml file: sources.bib and my_project.janno. Of course you can add them manually - init automatically creates empty dummy versions.

Once you have set up your own "Poseidon" package (which is really only a skeleton so far), you can add it to your trident analysis, by simply adding your project directory to the command using -d, for example:

```
197 trident list -d /path/to/poseidon/packages/modern \
198  -d /path/to/poseidon/packages/ReferenceGenomes
199  -d ~/my_project --packages
```

0.1.1.1.1 Logging and command line output For all subcommands the general argument --logMode defines how trident reports messages (to stderr) on the command line:

- NoLog: Hides all messages.
- SimpleLog: Plain and simple output to stderr.
- DefaultLog: Adds severity indicators before each message. (default setting)
- ServerLog: Additionally adds timestamps before each message.
 - *VerboseLog*: Shows not just messages on the log levels Info, Warning and Error like the other modes, but also on the more verbose level Debug. Use this for debugging.

109 **0.1.1.1.2 Duplicates**

- If multiple packages in a package repository share the same title, then trident will try to select the one with the highest version number. If this is not sufficient to resolve the conflict, trident will stop.
- Individual/sample names (Poseidon_IDs) within one package have to be unique, or trident will stop.
- We generally also discourage ID duplicates across packages in package repositories, but trident will generally continue with them after printing a warning. This does not apply for validate, by default (you can change this behaviour with --ignoreDuplicates), and forge offers a special mechanism to resolve duplicates within its selection language (see below).

0.1.1.1.3 Group names in .fam files The .fam file of Plink-formatted genotype data is used inconsistently across different popular aDNA software tools to store group/population name information. The (global) option --inPlinkPopName with the arguments asFamily (default), asPhenotype and asBoth allows to control the reading of the population name from Plink .fam files. The subcommands that write genotype data (forge, genoconvert) have a corresponding option --outPlinkPopName to specify this for the output.

0.1.1.1.4 Whitespaces in the .janno file While reading the .janno file trident trims all leading and trailing whitespaces around individual cells. Also all instances of the No-Break Space unicode character will be

removed. This means these whitespaces will not be preserved when a package is forged.

Init command init creates a new, valid Poseidon package from genotype data files. It adds a valid

0.1.2 Package creation and manipulation commands

125

POSEIDON. yml file, a dummy .janno file for context information and an empty .bib file for literature references. 127 Click here for command line details Usage: trident init ((-p|--genoOne ARG) | --inFormat ARG --genoFile ARG 129 --snpFile ARG --indFile ARG) [--snpSet ARG] 130 (-o|--outPackagePath ARG) [-n|--outPackageName ARG] 131 [--minimal] 132 Create a new Poseidon package from genotype data 133 Available options: 135 -h,--help Show this help text 136 -p,--genoOne ARG one of the input genotype data files. Expects .bed or 137 .bim or .fam for PLINK and .geno or .snp or .ind for 138 EIGENSTRAT. The other files must be in the same 139 directory and must have the same base name 140 the format of the input genotype data: EIGENSTRAT or --inFormat ARG 141 PLINK (only necessary for data input with --genoFile 142 + --snpFile + --indFile) 143 the input geno file path --genoFile ARG 144 --snpFile ARG the input snp file path 145 --indFile ARG the input ind file path 146 --snpSet ARG the snpSet of the package: 1240K, HumanOrigins or 147 Other. (only relevant for data input with 148 -p|--genoOne or --genoFile + --snpFile + --indFile, because the packages in a -d|--baseDir already have 150 this information in their respective POSEIDON.yml 151 files) Default: Other 152 -o, -- outPackagePath ARG the output package directory path 153 -n, -- outPackageName ARG the output package name - this is optional: If no 154 name is provided, then the package name defaults to 155 the basename of the (mandatory) --outPackagePath argument 157 --minimal should only a minimal output package be created? 158 The command 159 trident init \ 160 --inFormat EIGENSTRAT/PLINK \ 161 --genoFile path/to/geno_file \ 162 --snpFile path/to/snp_file \ 163 --indFile path/to/ind_file \ --snpSet 1240K|HumanOrigins|Other \ 165

```
-o path/to/new_package_name
```

166

requires the format (--inFormat) of your input data (either EIGENSTRAT or PLINK), the paths to the respective files (--genoFile, --snpFile, --indFile), and optionally the "shape" of these files (--snpSet), so if they cover the 1240K, the HumanOrigins or an Other SNP set. A simpler interface added in trident 0.29.0 is available with -p (+ --snpSet).

	EIGENSTRAT	PLINK
genoFile	.geno	.bed
${\rm snpFile}$.snp	$. \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\$
$\operatorname{indFile}$.ind	.fam

The output package of init is created as a new directory -o, which should not already exist, and gets the package title corresponding to the basename of -o. You can also set the title explicitly with -n. The --minimal flag causes init to create a minimal package with a very basic POSEIDON.yml and no .bib and .janno files.

0.1.2.2 Fetch command fetch allows to download Poseidon packages from a remote Poseidon server. Read
 more about this repository here.

Click here for command line details

Download data from a remote Poseidon repository

183 Available options:

181 182

```
-h,--help
                                Show this help text
184
      -d,--baseDir DIR
                                a base directory to search for Poseidon Packages
185
                                (could be a Poseidon repository)
186
      --downloadAll
                                download all packages the server is offering
187
      --fetchFile ARG
                                A file with a list of packages. Works just as -f, but
188
                                multiple values can also be separated by newline, not
189
                                just by comma. -f and --fetchFile can be combined.
190
     -f,--fetchString ARG
                                List of packages to be downloaded from the remote
191
                                server. Package names should be wrapped in asterisks:
192
                                *package_title*. You can combine multiple values with
193
                                comma, so for example: "*package_1*, *package_2*,
194
                                *package_3*". fetchString uses the same parser as
195
                                forgeString, but does not allow excludes. If groups
196
                                or individuals are specified, then packages which
197
                                include these groups or individuals are included in
198
                                the download.
199
                                URL of the remote Poseidon server
200
      --remoteURL ARG
                                (default: "https://c107-224.cloud.gwdg.de")
201
                                overwrite outdated local package versions
      -u,--upgrade
202
```

```
trident fetch -d ... -d ... \
204
      -f "*package_title_1*,*package_title_2*,*package_title_3*,group_name,<Individual1>"
    and the entities you want to download must be listed either in a simple string of comma-separated values, which
206
    can be passed via -f/--fetchString, or in a text file (--fetchFile). Entities are then combined from these
207
    sources.
    Entities are specified using a special syntax (see also the documentation of forge below): Package titles are
209
    wrapped in asterisks: package_title, group names are spelled as is, and individual names are wrapped in angular
210
   brackets, liks <Individual1>. Fetch will figure out which packages need to be downloaded to include all specified
211
    entities. --downloadAll, which can be given instead of -f and --fetchFile, causes fetch to download all
212
    packages from the server. The downloaded packages are added in the first (!) -d directory (which gets created
213
   if it doesn't exist), but downloads are only performed if the respective packages are not already present in an
214
    up-to-date version in any of the -d dirs.
215
    Note that trident fetch makes most sense in combination with trident list --remote: First one can inspect
216
    what is available on the server, then one can create a custom fetch command.
217
   fetch also has the optional arguments --remote https:://..." to name an alternative poseidon server. The
218
    default points to the DAG server.
    To overwrite outdated package versions with fetch, the -u/--upgrade flag has to be set. Note that many file
220
   systems do not offer a way to recover overwritten files. So be careful with this switch.
221
    0.1.2.3 Forge command forge creates new Poseidon packages by extracting and merging packages,
    populations and individuals from your Poseidon repositories.
223
    Click here for command line details
224
    Usage: trident forge ((-d|--baseDir DIR) |
225
                              ((-p|--genoOne ARG) | --inFormat ARG --genoFile ARG
226
                                 --snpFile ARG --indFile ARG) [--snpSet ARG])
227
                            [--forgeFile ARG | (-f|--forgeString ARG)]
228
                            [--selectSnps ARG] [--intersect] [--outFormat ARG]
229
                            [--minimal] [--onlyGeno] (-o|--outPackagePath ARG)
230
                            [-n|--outPackageName ARG] [--packagewise]
231
                            [--outPlinkPopName ARG]
232
      Select packages, groups or individuals and create a new Poseidon package from
233
      them
234
235
    Available options:
236
      -h,--help
                                   Show this help text
237
      -d,--baseDir DIR
                                   a base directory to search for Poseidon Packages
238
                                   (could be a Poseidon repository)
239
                                   one of the input genotype data files. Expects .bed or
      -p,--genoOne ARG
240
                                   .bim or .fam for PLINK and .geno or .snp or .ind for
241
                                   EIGENSTRAT. The other files must be in the same
242
                                   directory and must have the same base name
243
```

It works with

the format of the input genotype data: EIGENSTRAT or --inFormat ARG PLINK (only necessary for data input with --genoFile 245 + --snpFile + --indFile) 246 --genoFile ARG the input geno file path 247 --snpFile ARG the input snp file path 248 --indFile ARG the input ind file path 249 --snpSet ARG the snpSet of the package: 1240K, HumanOrigins or 250 Other. (only relevant for data input with 251 -p|--genoOne or --genoFile + --snpFile + --indFile, 252 because the packages in a -d|--baseDir already have 253 this information in their respective POSEIDON.yml 254 files) Default: Other 255 --forgeFile ARG A file with a list of packages, groups or individual samples. Works just as -f, but multiple values can 257 also be separated by newline, not just by comma. 258 Empty lines are ignored and comments start with "#", so everything after "#" is ignored in one line. 260 Multiple instances of -f and --forgeFile can be 261 given. They will be evaluated according to their input order on the command line. 263 -f,--forgeString ARG List of packages, groups or individual samples to be 264 combined in the output package. Packages follow the syntax *package_title*, populations/groups are simply 266 group_id and individuals <individual_id>. You can 267 combine multiple values with comma, so for example: "*package_1*, <individual_1>, <individual_2>, 269 group_1". Duplicates are treated as one entry. 270 Negative selection is possible by prepending "-" to 271 the entity you want to exclude (e.g. "*package_1*, 272 -<individual_1>, -group_1"). forge will apply 273 excludes and includes in order. If the first entity 274 is negative, then forge will assume you want to merge 275 all individuals in the packages found in the baseDirs 276 (except the ones explicitly excluded) before the 277 exclude entities are applied. An empty forgeString 278 (and no --forgeFile) will therefore merge all 279 available individuals. If there are individuals in 280 your input packages with equal individual id, but 281 different main group or source package, they can be 282 specified with the special syntax 283 "<package:group:individual>". 284 --selectSnps ARG To extract specific SNPs during this forge operation, 285 provide a Snp file. Can be either Eigenstrat (file 286 ending must be '.snp') or Plink (file ending must be '.bim'). When this option is set, the output package 288

```
will have exactly the SNPs listed in this file. Any
289
                                SNP not listed in the file will be excluded. If
290
                                option '--intersect' is also set, only the SNPs
291
                                overlapping between the SNP file and the forged
292
                                packages are output.
293
      --intersect
                                Whether to output the intersection of the genotype
294
                                files to be forged. The default (if this option is
295
                                not set) is to output the union of all SNPs, with
296
                                genotypes defined as missing in those packages which
297
                                do not have a SNP that is present in another package.
298
                                With this option set, the forged dataset will
299
                                typically have fewer SNPs, but less missingness.
300
      --outFormat ARG
                                the format of the output genotype data: EIGENSTRAT or
301
                                PLINK. Default: PLINK
302
      --minimal
                                should only a minimal output package be created?
303
      --onlyGeno
                                should only the resulting genotype data be returned?
                                This means the output will not be a Poseidon package
305
      -o, -- outPackagePath ARG
                                the output package directory path
306
     -n,--outPackageName ARG
                                the output package name - this is optional: If no
307
                                name is provided, then the package name defaults to
308
                                the basename of the (mandatory) --outPackagePath
309
                                argument
310
      --packagewise
                                Skip the within-package selection step in forge. This
311
                                will result in outputting all individuals in the
312
                                relevant packages, and hence a superset of the
                                requested individuals/groups. It may result in better
314
                                performance in cases where one wants to forge entire
315
                                packages or almost entire packages. Details: Forge
316
                                conceptually performs two types of selection: First,
317
                                it identifies which packages in the supplied base
318
                                directories are relevant to the requested forge, i.e.
319
                                whether they are either explicitly listed using
320
                                *PackageName*, or because they contain selected
321
                                individuals or groups. Second, within each relevant
322
                                package, individuals which are not requested are
323
                                removed. This option skips only the second step, but
324
                                still performs the first.
325
                                Where to write the population/group name into the FAM
      --outPlinkPopName ARG
326
                                file in Plink-format. Three options are possible:
327
                                asFamily (default) | asPhenotype | asBoth. See also
328
                                --inPlinkPopName.
329
   forge can be used with
330
   trident forge -d ... -d ... \
      -f "*package_name*, group_id, <individual_id>" \
332
     -o path/to/new_package_name
333
```

```
where the entities (packages, groups/populations, individuals/samples) you want in the output package can be
denoted either as a string on the command line (-f/--forgeString), or in an input text file (--forgeFile).

See the section below for the syntax of this selection language. Do not forget to wrap the --forgeString query
in quotes.
```

Including one or multiple Poseidon packages with -d is not the only way to include data for a forge operation.

It is also possible to consider unpackaged genotype data directly with -p (+ --snpSet) or --inFormat +

--genoFile + --snpFile + --indFile (+ --snpSet). This makes the following example possible, where we

merge data from one Poseidon package and two genotype datasets to get a new EIGENSTRAT dataset.

```
trident forge \
342
      -d 2017_GonzalesFortesCurrentBiology \
343
      -p 2018_VeeramahPNAS/2018_VeeramahPNAS.fam \
344
      --inFormat PLINK \
      --genoFile 2017_HaberAJHG/2017_HaberAJHG.bed \
346
      --snpFile 2017 HaberAJHG/2017 HaberAJHG.bim \
347
      --indFile 2017_HaberAJHG/2017_HaberAJHG.fam \
      -f "<STR241.SG>,<ERS1790729.SG>,Iberia_HG.SG" \
349
      -o testpackage \
350
      --outFormat EIGENSTRAT \
      --onlyGeno
352
```

358

359

364

365

366

367

375

ol.1.2.3.1 The forge selection language The text in --forgeString and --forgeFile are parsed as a domain specific query language that describes precisely which entities should be compiled in the output package of a given forge operation. The language has multiple syntactic elements and a specific evaluation logic.

In general a --forgeString query consists of multiple entities, separated by ,. The main entities are Poseidon packages, groups/populations and individuals/samples:

- Each package title is surrounded by *: *package*. That means if you want all individuals of the Poseidon
 package 2019_Jeong_InnerEurasia in the output package you would add *2019_Jeong_InnerEurasia*
 to the query.
- Groups/populations are not specially marked: group. So to get all individuals of the group Swiss_Roman_period, you would simply add Swiss_Roman_period.
- Individuals/samples are surrounded by < and >: <individual>. ALAO26 therefore becomes <ALAO26>. A second way to denote individuals is with the more verbose and specific syntax <package:group:individual>. Such defined individuals take precedence over differently defined ones (so: directly with <individual> or as a subset of *package* or group). This allows to resolve duplication issues precisely at least in cases where the duplicated individuals differ in source package or primary group.

In the --forgeFile each line is treated as a separate forgeString, empty lines are ignored and #s start comments.

So this is a valid forgeFile:

```
# Packages
# Package1*, *package2*

# Groups and individuals from other packages beyond package1 and package2
# group1, <individual1>, group2, <individual2>, <individual3>
```

- 376 # group2 has two outlier individuals that should be ignored
- 377 -<bad_individual1> # This one has very low coverage
- 378 -<bad_individual2> # This one is from a different time period
- By prepending to the bad individuals, we can exclude them from the forged package. forge fig-
- ures out the final list of samples to include by executing all forge-entities in order. So an entity list
- *PackageA*,-<Individual1>,GroupA may result in a different outcome than *PackageA*,GroupA,-<Individual1>,
- depending on whether <Individual1> belongs to GroupA or not. If the forge entity list starts with a negative
- entity, or if the entity list is empty, forge will implicitly assume you want to include all individuals in all
- packages found in the baseDirs (except the ones explicitly excluded, of course).
- An empty forgeString will therefore merge all available individuals.
- O.1.2.3.2 Treatment of the .janno file while merging forge merges and subsets .janno files along with the genotype data. If a package lacks a .janno file, then a basic one will be created internally based on the information in the genotype data, and used for the output. Missing columns across packages will be filled with n/a.
- For merging two .janno files ${\bf A}$ and ${\bf B}$ the following rules apply regarding undefined, arbitrary additional columns:
 - If **A** has an additional column which is not in **B** then empty cells in the rows imported from **B** are filled with n/a.
 - If **A** and **B** share additional columns with identical column name, then they are treated as semantically identical units and merged accordingly.
 - In the resulting .janno file, all additional columns from both **A** and **B** are sorted alphabetically and appended after the normal, specified variables.
- 397 The following example illustrates the described behaviour:

398 **A.janno**

391

393

394

395

Poseidon_ID	Group_Name	Genetic_Sex	AdditionalColumn1	AdditionalColumn2
XXX011	POP1	M	A	D
XXX012	POP2	F	В	E
XXX013	POP1	M	\mathbf{C}	F

B.janno

Poseidon_ID	Group_Name	${\rm Genetic_Sex}$	AdditionalColumn3	AdditionalColumn2
YYY022	POP5	F	G	J
YYY023	POP5	F	Н	K
YYY024	POP5	M	I	L

$_{\circ}$ A.janno + B.janno

Poseidon_ID	Group_Name	e Genetic_Sex	${\bf Additional Column 1}$	${\bf Additional Column 2}$	${\bf Additional Column 3}$
XXX011	POP1	M	A	D	n/a

Poseidon_ID	Group_Name	Genetic_Sex	AdditionalColumn1	AdditionalColumn2	AdditionalColumn3
XXX012	POP2	F	В	E	n/a
XXX013	POP1	M	\mathbf{C}	F	n/a
YYY022	POP5	F	n/a	J	G
YYY023	POP5	F	n/a	K	H
YYY024	POP5	M	n/a	L	I

- 0.1.2.3.3 Other options Just as for init the output package of forge is created as a new directory -o.

 The title can also be explicitly defined with -n.
- --minimal allows for the creation of a minimal output package without .bib and .janno. This is especially
 useful for data analysis pipelines, where only the genotype data is required. Even more basic output comes with
 --onlyGeno, which means that only the genotype data is returned without any Poseidon package.
- forge has a an optional flag --intersect, that defines, if the genotype data from different packages should be merged with an **union** or an **intersect** operation. The default (if this option is not set) is to output the union of all SNPs, with genotypes defined as missing in samples from packages which do not have a SNP that is present in another package. With this option set, on the other hand, the forged dataset will typically have fewer SNPs, but less missingness.
- --intersect also influences the automatic determination of the snpSet field in the POSEIDON.yml file for the resulting package. If the snpSets of all input packages are identical, then the resulting package will just inherit this configuration. Otherwise forge applies the following pairwise merging logic:

Input snpSet A	Input snpSet B	intersect	Ouput snpSet
Other	*	*	Other
1240K	HumanOrigins	True	HumanOrigins
1240K	HumanOrigins	False	1240K

- --selectSnps allows to provide forge with a SNP file in EIGENSTRAT (.snp) or PLINK (.bim) format to create a package with a specific selection. When this option is set, the output package will have exactly the SNPs listed in this file. Any SNP not listed in the file will be excluded. If --intersect is also set, only the SNPs overlapping between the SNP file and the forged packages are output.
- Merging genotype data across different data sources and file formats is tricky. forge is more verbose about potential issues, if the --logMode flag is set to VerboseLog.
- The --onlyGeno command specifies that only genotype data should be output, not an entire Poseidon package.
- With --packagewise the within-package selection step in forge can be skipped. This will result in outputting all individuals in the relevant packages, and hence a superset of the requested individuals/groups. It may result in better performance in cases where one wants to forge entire packages.
- 424 **0.1.2.4 Genoconvert command** genoconvert converts the genotype data in a Poseidon package to a different file format. The respective entries in the POSEIDON.yml file are changed accordingly.
- ⁴²⁶ Click here for command line details

```
Usage: trident genoconvert ((-d|--baseDir DIR) |
                                  ((-p|--genoOne ARG) | --inFormat ARG --genoFile ARG
428
                                    --snpFile ARG --indFile ARG) [--snpSet ARG])
429
                                --outFormat ARG [--onlyGeno]
430
                                [-o|--outPackagePath ARG] [--removeOld]
431
                                [--outPlinkPopName ARG]
432
     Convert the genotype data in a Poseidon package to a different file format
433
434
   Available options:
435
     -h,--help
                                Show this help text
436
     -d,--baseDir DIR
                                a base directory to search for Poseidon Packages
437
                                (could be a Poseidon repository)
438
                                one of the input genotype data files. Expects .bed or
     -p,--genoOne ARG
                                .bim or .fam for PLINK and .geno or .snp or .ind for
440
                                EIGENSTRAT. The other files must be in the same
441
                                directory and must have the same base name
     --inFormat ARG
                                the format of the input genotype data: EIGENSTRAT or
443
                                PLINK (only necessary for data input with --genoFile
444
                                + --snpFile + --indFile)
445
     --genoFile ARG
                                the input geno file path
446
     --snpFile ARG
                                the input snp file path
447
     --indFile ARG
                                the input ind file path
448
     --snpSet ARG
                                the snpSet of the package: 1240K, HumanOrigins or
449
                                Other. (only relevant for data input with
450
                                -p|--genoOne or --genoFile + --snpFile + --indFile,
                                because the packages in a -d|--baseDir already have
452
                                this information in their respective POSEIDON.yml
453
                                files) Default: Other
454
     --outFormat ARG
                                the format of the output genotype data: EIGENSTRAT or
455
                                PLINK.
456
     --onlyGeno
                                should only the resulting genotype data be returned?
457
                                This means the output will not be a Poseidon package
458
     -o,--outPackagePath ARG
                                the output package directory path - this is optional:
459
                                If no path is provided, then the output is written to
460
                                the directories where the input genotype data file
461
                                (.bed/.geno) is stored
462
     --removeOld
                                Remove the old genotype files when creating the new
463
                                ones
464
                                Where to write the population/group name into the FAM
     --outPlinkPopName ARG
465
                                file in Plink-format. Three options are possible:
                                asFamily (default) | asPhenotype | asBoth. See also
467
                                --inPlinkPopName.
468
   With the default setting
   trident genoconvert -d ... -d ... --outFormat EIGENSTRAT|PLINK
```

```
not already in this format. This includes updating the respective POSEIDON.yml files.
472
   The "old" data is not deleted, but kept around. That means conversion can result in a package with both PLINK
   and EIGENSTRAT data, but only one is linked in the POSEIDON.yml file, and that is what will be used by
474
   trident. To delete the old data in the conversion you can add the --removeOld flag.
475
   Instead of -d to change Poseidon packages, the -p (+ --snpSet) or --inFormat + --genoFile + --snpFile
   + --indFile (+ --snpSet) allow to directly convert genotype data that is not wrapped in a Poseidon package
477
   and store it to a directory given in -o. See this example:
478
    trident genoconvert \
479
      -p 2018_Mittnik_Baltic/Mittnik_Baltic.bed \
480
      --outFormat EIGENSTRAT
481
      -o my_directory
            Update command update automatically harmonizes POSEIDON.yml files of one or multiple
483
   packages if the packages were changed. This is not an automatic update from one Poseidon version to the next!
484
   Click here for command line details
   Usage: trident update (-d|--baseDir DIR) [--poseidonVersion ARG]
486
                            [--ignorePoseidonVersion] [--versionComponent ARG]
                            [--noChecksumUpdate] [--newContributors ARG]
488
                            [--logText ARG] [--force]
489
     Update POSEIDON.yml files automatically
   Available options:
492
      -h,--help
                                 Show this help text
      -d,--baseDir DIR
                                 a base directory to search for Poseidon Packages
                                 (could be a Poseidon repository)
495
                                 Poseidon version the packages should be updated to:
      --poseidonVersion ARG
                                 e.g. "2.5.3" (default: Nothing)
497
                                 Read packages even if their poseidonVersion is not
      --ignorePoseidonVersion
498
                                 compatible with the trident version. The assumption
                                 is, that the package is already structurally adjusted
500
                                 to the trident version and only the version number is
501
                                 lagging behind.
      --versionComponent ARG
                                 Part of the package version number in the
503
                                 POSEIDON.yml file that should be updated: Major,
504
                                 Minor or Patch (see https://semver.org)
505
                                 (default: Patch)
                                 Should update of checksums in the POSEIDON.yml file
      --noChecksumUpdate
507
                                 be skipped
508
                                 ignore SNP and GenoFile
      --ignoreGeno
509
                                 Contributors to add to the POSEIDON.yml file in the
      --newContributors ARG
510
                                 form "[Firstname Lastname](Email address);..."
511
      --logText ARG
                                 Log text for this version jump in the CHANGELOG file
512
```

all packages in -d will be converted to the desired --outFormat (either EIGENSTRAT or PLINK), if the data is

```
(default: "not specified")
513
                                 Normally the POSEIDON.yml files are only changed if
       -force
514
                                 the poseidonVersion is adjusted or any of the
515
                                 checksums change. With --force a package version
516
                                 update can be triggered even if this is not the case.
517
   It can be called with a lot of optional arguments
518
    trident update -d ... -d ... \
519
      --poseidonVersion "X.X.X" \
520
      --versionComponent Major/Minor/Patch \
521
      --noChecksumUpdate
522
      --ignoreGeno
523
      --newContributors "[Firstname Lastname] (Email address);..."
      --logText "short description of the update"
525
      --force
526
```

By default update will not edit a package's POSEIDON.yml file, even when arguments like --versionComponent,
--newContributors or --logText are explicitly set. This default exists to run the function on a large set of
packages where only few of them were edited and need an active update. A package will only be modified by
update if either

- any of the files with checksums (e.g. the genotype data) in it were modified,
- the --poseidonVersion argument differs from the poseidonVersion in the package's POSEIDON.yml file
- or the --force flag was set in update.

531

532

533

534

537

539

540

542

543

545

546

548

549

550

551

552

If any of these applies to a package in the search directory (--baseDir/-d), it will be updated. This includes the following steps:

- If --poseidonVersion is different from the poseidonVersion field in the package, then that will be updated.
- The packageVersion will be incremented. If --versionComponent is not set, then it falls back to Patch, so a change in the last position of the three digit version number. Minor increments the middle, and Major the first position (see semantic versioning).
- The lastModified field will be updated to the current day (based on your computer's system time).
- The contributors in --newContributors will be added to the contributor field if they're not there already.
- If any checksums changed, then they will be updated. If certain checksums are not set yet, then they will be added. The checksum update can be skipped with --noChecksumUpdate or partially skipped for the genotype data with --ignoreGeno.
- The CHANGELOG.md file will be updated with a new row for the new version and the text in --logText (default: "not specified"), which will be appended as the first line of the file. If no CHANGELOG.md file exists, then it will be created and referenced in the POSEIDON.yml file.

:heavy_exclamation_mark: As update reads and rewrites POSEIDON.yml files, it may change their inner order, layout or even content (e.g. if they have fields which are not in the Poseidon package definition). Create a backup of the POSEIDON.yml file before running update if you are uncertain.

0.1.3 Inspection commands

```
0.1.3.1 List command list lists packages, groups and individuals of the datasets you use, or of the
   packages available on the server.
555
   Click here for command line details
556
   Usage: trident list ((-d|--baseDir DIR) | --remote [--remoteURL ARG])
                     (--packages | --groups | --individuals
558
                       [-j|--jannoColumn JANNO_HEADER]) [--raw]
559
     List packages, groups or individuals from local or remote Poseidon
     repositories
561
562
   Available options:
     -h,--help
                           Show this help text
564
     -d,--baseDir DIR
                           a base directory to search for Poseidon Packages
565
                            (could be a Poseidon repository)
                            list packages from a remote server instead the local
     --remote
567
                            file system
568
                            URL of the remote Poseidon server
     --remoteURL ARG
                            (default: "https://c107-224.cloud.gwdg.de")
570
                            list all packages
     --packages
571
     --groups
                           list all groups, ignoring any group names after the
572
                            first as specified in the Janno-file
573
                            list individuals
     --individuals
574
     -j,--jannoColumn JANNO_HEADER
575
                            list additional fields from the janno files, using
576
                            the Janno column heading name, such as Country, Site,
577
                           Date_C14_Uncal_BP, Endogenous, ...
578
                            output table as tsv without header. Useful for piping
     --raw
579
                            into grep or awk
580
     --ignoreGeno
                            ignore SNP and GenoFile
581
   To list packages from your local repositories, as seen above you can run
582
   trident list -d ... -d ... --packages
583
   This will yield a table like this
    585
                    Title
                                         - 1
                                              Date
                                                    | Nr Individuals |
   587
   588
   | 2018_BostonDatashare_modern_published
                                         | 2020-08-10 | 2772
590
   1 ...
                                         1 ...
                                                     591
```

so a nicely formatted table of all packages, their last update and the number of individuals in it.

To view packages on the remote server, instead of using directories to specify the locations of repositories on

```
your system, you can use --remote to show packages on the remote server. For example
    trident list --packages --remote
596
    will result in a view of all published packages in our public online repository.
    You can also list groups, as defined in the third column of EIGENSTRAT .ind files (or the first column of a
598
   PLINK .fam file), and individuals with --groups and --individuals instead of --packages.
    The --individuals flag provides a way to immediately access information from the .janno files on the
600
    command line. This works with the -j/--jannoColumn option. For example adding --jannoColum Country
601
    --jannoColumn Date_C14_Uncal_BP to the commands above will add the Country and the Date_C14_Uncal_BP
    columns to the respective output tables.
603
   Note that if you want a less fancy table, for example because you want to load this into Excel, or pipe into
604
    another command that cannot deal with the neat table layout, you can use the --raw option to output that
    table as a simple tab-delimited stream.
606
   0.1.3.2
             Summarise command
                                       summarise prints some general summary statistics for a given poseidon
607
    dataset taken from the .janno files.
    Click here for command line details
609
    Usage: trident summarise (-d|--baseDir DIR) [--raw]
610
      Get an overview over the content of one or multiple Poseidon packages
611
612
   Available options:
613
      -h,--help
                                  Show this help text
614
      -d,--baseDir DIR
                                  a base directory to search for Poseidon Packages
615
                                   (could be a Poseidon repository)
616
      --raw
                                   output table as tsv without header. Useful for piping
617
                                  into grep or awk
618
   You can run it with
    trident summarise -d ... -d ...
620
   which will show you context information like - among others - the number of individuals in the dataset, their
    sex distribution, the mean age of the samples (for ancient data) or the mean coverage on the 1240K SNP array
622
   in a table. summarise depends on complete .janno files and will silently ignore missing information for some
623
   statistics.
    You can use the --raw option to output the summary table in a simple, tab-delimited layout.
625
            Survey command survey tries to indicate package completeness (mostly focused on . janno files)
626
    for poseidon datasets.
    Click here for command line details
628
   Usage: trident survey (-d|--baseDir DIR) [--raw]
      Survey the degree of context information completeness for Poseidon packages
630
631
   Available options:
```

632

```
633 -h,--help Show this help text
```

634 -d,--baseDir DIR a base directory to search for Poseidon Packages

(could be a Poseidon repository)

636 --raw output table as tsv without header. Useful for piping

into grep or awk

638 Running

635

647

651

654

657

664

666

667

669

639 trident survey -d ... -d ...

will yield a table with one row for each package. See trident survey -h for a legend which cell of this table means what.

642 Again you can use the --raw option to output the survey table in a tab-delimited format.

old validate command validate checks poseidon datasets for structural correctness.

644 Click here for command line details

645 Usage: trident validate (-d|--baseDir DIR)

646 Check one or multiple Poseidon packages for structural correctness

648 Available options:

649 -h,--help Show this help text

650 -d,--baseDir DIR a base directory to search for Poseidon Packages

(could be a Poseidon repository)

652 --ignoreGeno ignore SNP and GenoFile

653 --fullGeno test parsing of all SNPs (by default only the first

100 SNPs are probed)

655 --noExitCode do not produce an explicit exit code

656 --ignoreDuplicates do not stop on duplicated individual names in the

package collection

You can run it with

659 trident validate -d ... -d ...

and it will either report a success (Validation passed) or failure with specific error messages to simplify fixing the issues.

validate tries to ensure that each package in the dataset adheres to the schema definition. Here is a list of what is checked:

- Presence of the necessary files
- Full structural correctness of .bib and .janno file
- Superficial correctness of genotype data files by parsing the first 100 SNPs. A full check that parses all SNPs can be run with the --fullGeno option
 - Correspondence of BibTeX keys in .bib and .janno
 - Correspondence of individual and group IDs in .janno and genotype data files

In fact much of this validation already runs as part of the general package reading pipeline invoked for many trident subcommands (e.g. forge). validate is meant to be more thorough, though, and will explicitly fail if even a single package is broken.

673 674	Remember to run it withlogMode VerboseLog to get more information if the output is not sufficient to debug an issue.
