18		4.4 Validate command	14		
19	5	Analysis commands	15		
20	1	Poseidon package repositories			
21	Tri	dent generally requires Poseidon datasets to work with. Most trident subcommands therefore have a	central		
22	parameter, calledbaseDir or simply -d to specify one or more base directories to look for Poseidon packages				
23	Fo	example, if all Poseidon packages live inside a repository at /path/to/poseidon/packages you	would		
24	simply say trident <subcommand> -d /path/to/poseidon/dirs/ and trident would automatically search</subcommand>				
25	all	subdirectories inside of the repository for valid poseidon packages (as identified by valid POSEIDO	N.yml		
26	file	8).			
27	Yo	ı can arrange a poseidon repository in a hierarchical way. For example:			
28	/p	th/to/poseidon/packages			
29		/modern			
30		/2019_poseidon_package1			
31		/2019_poseidon_package2			
32		/ancient			

```
/...
33
            /...
34
       /Reference_Genomes
35
            /...
            /...
37
       /Archaic_Humans
38
            /...
39
            /...
40
   You can use this structure to select only the level of packages you're interested in, and you can make use of the
   fact that -d can be given multiple times.
42
   Let's use the list command to list all packages in the modern and Reference_Genomes:
43
   trident list -d /path/to/poseidon/packages/modern \
     -d /path/to/poseidon/packages/ReferenceGenomes --packages
45
   \mathbf{2}
        Analysing your own dataset outside of the main repository
   Being able to specify one or multiple repositories is often not enough, as you may have your own data to
   co-analyse with the main repository. This is easy to do, as you simply need to provide your own genotype data
   as yet another poseidon package to be added to your trident list command. For example, let's say you have
49
   genotype data in EIGENSTRAT format (trident supports EIGENSTRAT and PLINK as formats.):
50
   ~/my_project/my_project.geno
   ~/my_project/my_project.snp
52
   ~/my_project/my_project.ind
53
   then you can make that to a skeleton Poseidon package with the init command. You can also do it manually
   by simply adding a POSEIDON.yml file, with for example the following content:
55
   poseidonVersion: 2.5.0
   title: My_awesome_project
57
   description: Unpublished genetic data from my awesome project
58
   contributor:
59
     - name: Stephan Schiffels
60
       email: schiffels@institute.org
61
   packageVersion: 0.1.0
   lastModified: 2020-10-07
63
   genotypeData:
64
     format: EIGENSTRAT
65
     genoFile: my_project.geno
     snpFile: my_project.snp
67
     indFile: my_project.ind
   jannoFile: my_project.janno
69
   bibFile: sources.bib
```

Two remarks: 1) all file paths are considered *relative* to the directory in which POSEIDON.yml resides. Here I assume that you put this file into the same directory as the three genotype files. 2) Besides the genotype data

```
files there are two (technically optional) files referenced by this example POSEIDON.yml file: sources.bib
and my_project.janno. Of course you can add them manually - init automatically creates empty dummy
versions.

Once you have set up your own "Poseidon" package (which is really only a skeleton so far), you can add it to
your trident analysis, by simply adding your project directory to the command using -d:

trident list -d /path/to/poseidon/packages/modern \
-d /path/to/poseidon/packages/ReferenceGenomes
-d ~/my_project --packages
```

# 3 Package creation and manipulation commands

### $_{2}$ 3.1 Init command

init creates a new, valid poseidon package from genotype data files. It adds a valid POSEIDON.yml file, a dummy janno file for context information and an empty bib file for literature references.

Click here for command line details

```
Usage: trident init (-r|--inFormat ARG) (-g|--genoFile ARG) (-s|--snpFile ARG)
86
                         (-i|--indFile ARG) [--snpSet ARG] (-o|--outPackagePath ARG)
87
                         [-n|--outPackageName ARG] [--minimal]
88
     Create a new Poseidon package from genotype data
89
   Available options:
91
      -h,--help
                                Show this help text
92
      -r,--inFormat ARG
                                the format of the input genotype data: EIGENSTRAT or
                                PLINK
      -g,--genoFile ARG
                                the input geno file path
95
     -s,--snpFile ARG
                                the input snp file path
      -i,--indFile ARG
                                the input ind file path
97
      --snpSet ARG
                                the snpSet of the new package: 1240K, HumanOrigins or
                                Other. Default: Other
qq
                                the output package directory path
      -o,--outPackagePath ARG
100
      -n, -- outPackageName ARG
                                the output package name - this is optional: If no
101
                                name is provided, then the package name defaults to
102
                                the basename of the (mandatory) --outPackagePath
103
                                argument
104
      --minimal
                                should only a minimal output package be created?
105
   The command
106
   trident init \
107
     -r EIGENSTRAT/PLINK \
108
      -g path/to/geno_file \
109
     -s path/to/snp_file \
110
     -i path/to/ind_file \
111
      --snpSet 1240K|HumanOrigins|Other \
112
```

```
-o path/to/new_package_name
```

113

requires the format -r (--inFormat) of your input data (either EIGENSTRAT or PLINK), the paths to the 114 respective files in -g (--genoFile), -s (--snpFile), and -i (--indFile), and optionally the "shape" 115 of these files ( --snpSet ), so if they cover the 1240K, the HumanOrigins or an Other SNP set. 116

	EIGENSTRAT	PLINK
genoFile	.geno	.bed
${\rm snpFile}$	.snp	$. \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\$
$\operatorname{indFile}$	.ind	.fam

The output package of init is created as a new directory -o, which should not already exist, and gets the 117 package title corresponding to the basename of -o . You can also set the title explicitly with -n . The 118 --minimal flag causes init to create a minimal package with a very basic POSEIDON.yml and no .bib and 119 . janno files. 120

#### 3.2Fetch command

fetch allows to download poseidon packages from a remote poseidon server. 122

Click here for command line details 123

```
Usage: trident fetch (-d|--baseDir DIR) [-f|--fetchString ARG] [--fetchFile ARG]
124
                         [--remoteURL ARG] [-u|--upgrade] [--downloadAll]
125
```

Show this help text

Download data from a remote Poseidon repository

```
Available options:
128
      -h,--help
```

It works with

126 127

129

	<del>-</del>	
130	-d,baseDir DIR	a base directory to search for Poseidon Packages
131		(could be a Poseidon repository)
132	-f,fetchString ARG	List of packages to be downloaded from the remote
133		server. Package names should be wrapped in asterisks:
134		*package_title*. You can combine multiple values with
135		<pre>comma, so for example: "*package_1*, *package_2*,</pre>
136		*package_3*". fetchString uses the same parser as
137		forgeString, but does not allow excludes. If groups
138		or individuals are specified, then packages which
139		include these groups or individuals are included in
140		the download.
141	fetchFile ARG	A file with a list of packages. Works just as -f, but
142		multiple values can also be separated by newline, not
143		just by commaf andfetchFile can be combined.
144	remoteURL ARG	URL of the remote Poseidon
145		server (default: "https://c107-224.cloud.gwdg.de")
146	-u,upgrade	overwrite outdated local package versions
147	downloadAll	download all packages the server is offering

```
trident fetch -d ... -d ... \
    -f "*package_title_1*,*package_title_2*,*package_title_3*,group_name,<Individual1>" \
    -fetchFile path/to/forgeFile
```

and the entities you want to download must be listed either in a simple string with comma-separated values

(-f / --fetchString) or in a text file (--fetchFile). Entities are specified using a special syntax: Package

titles are wrapped in asterisks: package\_title (see also the documentation of forge below), group names are

spelled as is, and individual names are wrapped in angular brackets, liks <Individual1>. Fetch will figure

out which packages need to be downloaded to include all specified entities. --downloadAll causes fetch to

ignore -f and download all packages from the server. The downloaded packages are added in the first (!) -d

directory, but downloads are only performed if the respective packages are not already present in an up-to-date

version in any of the -d dirs.

Note that trident fetch makes most sense in combination with trident list --remote: First one can inspect what is available on the server, then one can create a custom fetch command.

fetch also has the optional arguments --remote https:://..." do name an alternative poseidon server.

The default points to the DAG server.

To overwrite outdated package versions with fetch, the -u / --upgrade flag has to be set. Note that many file systems do not offer a way to recover overwritten files. So be careful with this switch.

## 3.3 Forge command

166

forge creates new poseidon packages by extracting and merging packages, populations and individuals from your poseidon repositories.

169 Click here for command line details

```
Usage: trident forge [-d|--baseDir DIR]
                          [(-r|--inFormat ARG) (-g|--genoFile ARG) (-s|--snpFile ARG)
171
                            (-i|--indFile ARG) [--snpSet ARG]]
172
                          [--forgeFile ARG | (-f|--forgeString ARG)]
173
                          [--selectSnps ARG] [--intersect] [--outFormat ARG]
174
                          [--minimal] [--onlyGeno] (-o|--outPackagePath ARG)
175
                          [-n|--outPackageName ARG] [-w|--warnings] [--no-extract]
176
     Select packages, groups or individuals and create a new Poseidon package from
177
      them
178
   Available options:
180
      -h,--help
                                Show this help text
181
      -d,--baseDir DIR
                                a base directory to search for Poseidon Packages
182
                                 (could be a Poseidon repository)
183
                                the format of the input genotype data: EIGENSTRAT or
      -r,--inFormat ARG
184
                                PLINK
185
                                the input geno file path
      -g,--genoFile ARG
186
      -s,--snpFile ARG
                                the input snp file path
187
     -i,--indFile ARG
                                the input ind file path
188
                                the snpSet of the new package: 1240K, HumanOrigins or
      --snpSet ARG
```

190		Other. Default: Other
191	forgeFile ARG	A file with a list of packages, groups or individual
192		samples. Works just as -f, but multiple values can
193		also be separated by newline, not just by comma.
194		Empty lines are ignored and comments start with "#",
195		so everything after "#" is ignored in one line.
196	-f,forgeString ARG	List of packages, groups or individual samples to be
197		combined in the output package. Packages follow the
198		<pre>syntax *package_title*, populations/groups are simply</pre>
199		<pre>group_id and individuals <individual_id>. You can</individual_id></pre>
200		combine multiple values with comma, so for example:
201		<pre>"*package_1*, <individual_1>, <individual_2>,</individual_2></individual_1></pre>
202		<pre>group_1". Duplicates are treated as one entry.</pre>
203		Negative selection is possible by prepending "-" to
204		the entity you want to exclude (e.g. "*package_1*,
205		- <individual_1>, -group_1"). forge will apply</individual_1>
206		excludes and includes in order. If the first entity
207		is negative, then forge will assume you want to merge
208		all individuals in the packages found in the baseDirs
209		(except the ones explicitly excluded) before the
210		exclude entities are applied. An empty forgeString
211		will therefore merge all available individuals.
212	selectSnps ARG	To extract specific SNPs during this forge operation,
213	1	provide a Snp file. Can be either Eigenstrat (file
214		ending must be '.snp') or Plink (file ending must be
215		'.bim'). When this option is set, the output package
216		will have exactly the SNPs listed in this file. Any
217		SNP not listed in the file will be excluded. If
218		option 'intersect' is also set, only the SNPs
219		overlapping between the SNP file and the forged
220	intergect	packages are output.
221	intersect	Whether to output the intersection of the genotype
222		files to be forged. The default (if this option is
223		not set) is to output the union of all SNPs, with
224		genotypes defined as missing in those packages which
225		do not have a SNP that is present in another package.
226		With this option set, the forged dataset will
227		typically have fewer SNPs, but less missingness.
228	outFormat ARG	the format of the output genotype data: EIGENSTRAT or
229		PLINK. Default: PLINK
230	minimal	should only a minimal output package be created?
231	onlyGeno	should only the resulting genotype data be returned?
232		This means the output will not be a Poseidon package
233	-o,outPackagePath ARG	the output package directory path
234	-n,outPackageName ARG	the output package name - this is optional: If no

```
name is provided, then the package name defaults to
235
                                 the basename of the (mandatory) --outPackagePath
236
                                 argument
237
                                 Show all warnings for merging genotype data
      -w,--warnings
238
                                 Skip the selection step in forge. This will result in
      --no-extract
239
                                 outputting all individuals in the relevant packages,
240
                                 and hence a superset of the requested
241
                                 individuals/groups. It may result in better
242
                                 performance in cases where one wants to forge entire
243
                                 packages or almost entire packages. Note that this
244
                                 will also ignore any ordering in the output
245
                                 groups/individuals. With this option active,
246
                                 individuals from the relevant packages will just be
                                 written in the order that they appear in the original
248
                                 packages.
249
    forge can be used with
250
   trident forge -d ... -d ... \
251
      -f "*package_name*, group_id, <individual_id>" \
252
      --forgeFile path/to/forgeFile \
253
      -o path/to/new_package_name
254
   where the entities (packages, groups/populations, individuals/samples) you want in the output package can
   be denoted either as as simple string with comma-separated values (-f/--forgeString) or in a text file
256
   ( --forgeFile ).
257
   Including one or multiple Poseidon packages with -d is not the only way to include data for a forge operation.
258
   It is also possible to include unpackaged genotype data directly with -r + -g + -s + -i (+ --snpSet). This
259
   makes the following example possible, where we merge data from one Poseidon package and two genotype
260
   datasets.
   trident forge \
262
      -d 2017_GonzalesFortesCurrentBiology \
263
      -r PLINK \
264
      -g 2017_HaberAJHG/2017_HaberAJHG.bed \
265
      -s 2017_HaberAJHG/2017_HaberAJHG.bim \
266
      -i 2017_HaberAJHG/2017_HaberAJHG.fam \
267
      -r PLINK \
268
      -g 2018_VeeramahPNAS/2018_VeeramahPNAS.bed \
269
      -i 2018_VeeramahPNAS/2018_VeeramahPNAS.fam \
270
      -s 2018_VeeramahPNAS/2018_VeeramahPNAS.bim \
271
      -f "<STR241.SG>,<ERS1790729.SG>,Iberia_HG.SG" \
272
      -o testpackage \
273
      --onlyGeno
274
```

## 3.3.1 The forge selection language

275

276 Entities in the --forgeString or the --forgeFile have to be marked in a certain way:

- Each package is surrounded by \*, so if you want all individuals of 2019\_Jeong\_InnerEurasia in the output package you would add \*2019\_Jeong\_InnerEurasia\* to the list.
- Groups/populations are not specially marked. So to get all individuals of the group Swiss\_Roman\_period, you would simply add Swiss\_Roman\_period.
- Individuals/samples are surrounded by < and >, so ALA026 becomes <ALA026>.
- Do not forget to wrap the forgeString in quotes.
- You can either use -f / --forgeString or --forgeFile. In the file each line is treated as a separate forgeString, empty lines are ignored and # s start comments. So this is a valid forgeFile:
- 285 # Packages

277

278

279

280

281

290

- \*package1\*, \*package2\*
- 287
- $_{\mbox{\tiny 288}}$  # Groups and individuals from other packages beyond package1 and package2
- 289 group1, <individual1>, group2, <individual2>, <individual3>
- 291 # group2 has two outlier individuals that should be ignored
- 292 -<bad\_individual1> # This one has very low coverage
- 293 -<bad\_individual2> # This one is from a different time period
- By prepending to the bad individuals, we can exclude them from the forged package. forge fig-
- ures out the final list of samples to include by executing all forge-entities in order. So an entity list
- \*PackageA\*,-<Individual1>,GroupA may result in a different outcome than \*PackageA\*,GroupA,-<Individual1>,
- depending on whether <Individual1> belongs to GroupA or not. If the forge entity list starts with a negative
- entity, or if the entity list is empty, forge will implicitly assume you want to include all individuals in all
- packages found in the baseDirs (except the ones explicitly excluded, of course). An empty forgeString will
- 300 therefore merge all available individuals.

### 301 3.3.2 Other options

- Just as for init the output package of forge is created as a new directory -o. The title can also be explicitly defined with -n.
- or an inimal allows for the creation of a minimal output package without .bib and .janno. This might be especially useful for data analysis pipelines, where only the genotype data is required. Even more basic output
- comes with --onlyGeno, which means that only the genotype data is returned without any Poseidon package.
- forge has a an optional flag --intersect, that defines, if the genotype data from different packages should
- be merged with an union or an intersect operation. The default (if this option is not set) is to output the
- union of all SNPs, with genotypes defined as missing in samples from packages which do not have a SNP that is
- present in another package. With this option set, on the other hand, the forged dataset will typically have fewer
- 311 SNPs, but less missingness.
- --intersect also influences the automatic determination of the snpSet field in the POSEIDON.yml file for the resulting package. If the snpSet s of all input packages are identical, then the resulting package will just inherit this configuration. Otherwise forge applies the following pairwise merging logic:

Input snpSet A	Input snpSet B	intersect	Ouput $snpSet$
Other	*	*	Other

Input snpSet A	Input snpSet B	intersect	Ouput snpSet
1240K	HumanOrigins	True	HumanOrigins
$1240 \mathrm{K}$	${\bf Human Origins}$	False	$1240 \mathrm{K}$

--selectSnps allows to provide forge with a SNP file in EIGENSTRAT (.snp) or PLINK (.bim) format 315 to create a package with a specific selection. When this option is set, the output package will have exactly the 316 SNPs listed in this file. Any SNP not listed in the file will be excluded. If --intersect is also set, only the 317 SNPs overlapping between the SNP file and the forged packages are output. 318

Merging genotype data across different data sources and file formats is tricky. forge is more verbose about 319 potential issues, if the -w / --warnings flag is set.

#### Genoconvert command 3.4

genoconvert converts the genotype data in a Poseidon package to a different file format. The respective entries 322 in the POSEIDON.yml file are changed accordingly. 323

Click here for command line details 324

```
Usage: trident genoconvert [-d|--baseDir DIR]
                                 [(-r|--inFormat ARG) (-g|--genoFile ARG)
326
                                   (-s|--snpFile ARG) (-i|--indFile ARG)
327
                                   [--snpSet ARG]] --outFormat ARG [--onlyGeno]
                                 [--removeOld]
329
330
```

Convert the genotype data in a Poseidon package to a different file format

```
Available options:
332
```

321

331

```
-h,--help
                                Show this help text
333
      -d,--baseDir DIR
                                a base directory to search for Poseidon Packages
334
                                 (could be a Poseidon repository)
335
                                the format of the input genotype data: EIGENSTRAT or
      -r,--inFormat ARG
336
                                PLINK
337
      -g,--genoFile ARG
                                the input geno file path
338
      -s,--snpFile ARG
                                the input snp file path
339
      -i,--indFile ARG
                                the input ind file path
340
      --snpSet ARG
                                the snpSet of the new package: 1240K, HumanOrigins or
341
                                Other. Default: Other
342
                                the format of the output genotype data: EIGENSTRAT or
      --outFormat ARG
343
                                PLINK.
344
                                should only the resulting genotype data be returned?
      --onlyGeno
345
                                This means the output will not be a Poseidon package
346
                                Remove the old genotype files when creating the new
      --removeOld
347
                                 ones
348
```

With the default setting 349

```
trident genoconvert -d ... -d ... --outFormat EIGENSTRAT|PLINK
```

```
all packages in -d will be converted to the desired --outFormat (either EIGENSTRAT or PLINK), if the data is not already in this format. This includes updating the respective POSEIDON.yml files.

Instead of -d to change Poseidon packages, the combination -r + -g + -s + -i (+ --snpSet) allows to directly convert genotype data that is not wrapped in a Poseidon package. See this example:
```

```
trident genoconvert \
    -r PLINK \
    -g 2018_Mittnik_Baltic/Mittnik_Baltic.bed \
    -s 2018_Mittnik_Baltic/Mittnik_Baltic.bim \
    -i 2018_Mittnik_Baltic/Mittnik_Baltic.fam \
    --outFormat EIGENSTRAT
```

The "old" data is not deleted, but kept around. That means conversion will result in a package with both PLINK and EIGENSTRAT data, but only one is linked in the POSEIDON.yml file, and that is what will be used by trident. To delete the old data in the conversion you can add the --removeOld flag.

Remember that the POSEIDON.yml file can also be edited by hand if you want to replace the genotype data in a package.

# 3.5 Update command

update automatically updates POSEIDON.yml files of one or multiple packages if the packages were changed.

368 Click here for command line details

389

391

```
Usage: trident update (-d|--baseDir DIR) [--poseidonVersion ARG]
                           [--ignorePoseidonVersion] [--versionComponent ARG]
370
                           [--noChecksumUpdate] [--newContributors ARG]
371
                           [--logText ARG] [--force]
     Update POSEIDON.yml files automatically
373
374
   Available options:
     -h,--help
                                Show this help text
376
     -d,--baseDir DIR
                                a base directory to search for Poseidon Packages
377
                                (could be a Poseidon repository)
                                Poseidon version the packages should be updated to:
     --poseidonVersion ARG
379
                                e.g. "2.5.3" (default: Nothing)
     --ignorePoseidonVersion
```

e.g. "2.5.3" (default: Nothing)

--ignorePoseidonVersion Read packages even if their poseidonVersion is not compatible with the trident version. The assumption is, that the package is already structurally adjusted to the trident version and only the version number is lagging behind.

--versionComponent ARG Part of the package version number in the POSEIDON.yml file that should be updated: Major,

Minor or Patch (see
https://semver.org) (default: Patch)

--noChecksumUpdate Should update of checksums in the POSEIDON.yml file

be skipped

```
--ignoreGeno
                                ignore SNP and GenoFile
392
     --newContributors ARG
                                Contributors to add to the POSEIDON.yml file in the
393
                                form "[Firstname Lastname](Email address);..."
     --logText ARG
                                Log text for this version jump in the CHANGELOG
395
                                file (default: "not specified")
396
     --force
                                Normally the POSEIDON.yml files are only changed if
397
                                the poseidonVersion is adjusted or any of the
398
                                checksums change. With --force a package version
399
                                update can be triggered even if this is not the case.
```

401 It can be called with a lot of optional arguments

```
trident update -d ... -d ... \
--poseidonVersion "X.X.X" \
--versionComponent Major/Minor/Patch \
--noChecksumUpdate
--ignoreGeno
--newContributors "[Firstname Lastname](Email address);..."
--logText "short description of the update"
--force
```

By default update will not edit a package's POSEIDON.yml file, even when arguments like --versionComponent,

--newContributors or --logText are explicitly set. This default exists to run the function on a large set of

packages where only few of them were edited and need an active update. A package will only be modified by

update if either

- any of the files with checksums (e.g. the genotype data) in it were modified,
- the --poseidonVersion argument differs from the poseidonVersion in the package's POSEIDON.yml
- or the --force flag was set in update.

414

415 416

417

421

422

424

425

427

428

430

431

432

433

If any of these applies to a package in the search directory ( --baseDir / -d ), it will be updated. This includes the following steps:

- If --poseidonVersion is different from the poseidonVersion field in the package, then that will be updated.
- The packageVersion will be incremented. If --versionComponent is not set, then it falls back to Patch, so a change in the last position of the three digit version number. Minor increments the middle, and Major the first position (see semantic versioning).
- The lastModified field will be updated to the current day (based on your computer's system time).
- The contributors in --newContributors will be added to the contributor field if they're not there already.
- If any checksums changed, then they will be updated. If certain checksums are not set yet, then they will be added. The checksum update can be skipped with --noChecksumUpdate or partially skipped for the genotype data with --ignoreGeno.
- The CHANGELOG.md file will be updated with a new row for the new version and the text in --logText (default: "not specified"), which will be appended as the first line of the file. If no CHANGELOG.md file exists, then it will be created and referenced in the POSEIDON.yml file.

434 :heavy\_exclamation\_mark: As update reads and rewrites POSEIDON.yml files, it may change their inner

order, layout or even content (e.g. if they have fields which are not in the Poseidon package definition). Create a backup of the POSEIDON.yml file before running update if you are uncertain.

# <sub>7</sub> 4 Inspection commands

| 2018\_BostonDatashare\_modern\_published

### 4.1 List command

```
list lists packages, groups and individuals of the datasets you use, or of the packages available on the server.
439
   Click here for command line details
440
   Usage: trident list ((-d|--baseDir DIR) | --remote [--remoteURL ARG])
441
                       (--packages | --groups | --individuals
442
                         [-j|--jannoColumn JANNO_HEADER]) [--raw]
443
     List packages, groups or individuals from local or remote Poseidon
444
     repositories
445
446
   Available options:
     -h,--help
                              Show this help text
448
     -d,--baseDir DIR
                              a base directory to search for Poseidon Packages
449
                              (could be a Poseidon repository)
     --remote
                              list packages from a remote server instead the local
451
                              file system
452
                              URL of the remote Poseidon
     --remoteURL ARG
453
                              server (default: "https://c107-224.cloud.gwdg.de")
454
     --packages
                              list all packages
455
     --groups
                              list all groups, ignoring any group names after the
456
                              first as specified in the Janno-file
457
     --individuals
                              list individuals
458
     -j,--jannoColumn JANNO_HEADER
                              list additional fields from the janno files, using
460
                              the Janno column heading name, such as Country, Site,
461
                              Date_C14_Uncal_BP, Endogenous, ...
     --raw
                              output table as tsv without header. Useful for piping
463
                              into grep or awk
464
                              ignore SNP and GenoFile
     --ignoreGeno
465
   To list packages from your local repositories, as seen above you can run
   trident list -d ... -d ... --packages
467
   This will yield a table like this
468
469
                                             1
                      Title
                                                 Date
                                                          | Nr Individuals |
   ;======;=====;=====;=====;=====;
471
   472
```

| 2020-08-10 | 2772

```
1 ...
                                                                  1
476
   so a nicely formatted table of all packages, their last update and the number of individuals in it.
   To view packages on the remote server, instead of using directories to specify the locations of repositories on
478
   your system, you can use --remote to show packages on the remote server. For example
479
   trident list --packages --remote
480
   will result in a view of all published packages in our public online repository.
481
   You can also list groups, as defined in the third column of EIGENSTRAT .ind files (or the first column of a
482
   PLINK .fam file), and individuals:
483
   trident list -d ... -d ... --groups
   trident list -d ... -d ... --individuals
   The --individuals flag also provides a way to immediately access information from the .janno
486
   files on the command line. This works with the -j / -- jannoColumn option. For example adding
    --jannoColum Country --jannoColumn Date_C14_Uncal_BP to the commands above will add the Country
488
   and the Date_C14_Uncal_BP columns to the respective output tables.
489
   Note that if you want a less fancy table, for example because you want to load this into Excel, or pipe into
   another command that cannot deal with the neat table layout, you can use the --raw option to output that
491
   table as a simple tab-delimited stream.
492
          Summarise command
   4.2
    summarise prints some general summary statistics for a given poseidon dataset taken from the .janno files.
494
   Click here for command line details
   Usage: trident summarise (-d|--baseDir DIR) [--raw]
496
      Get an overview over the content of one or multiple Poseidon packages
497
   Available options:
499
      -h,--help
                                  Show this help text
500
      -d,--baseDir DIR
                                  a base directory to search for Poseidon Packages
501
                                  (could be a Poseidon repository)
502
                                  output table as tsv without header. Useful for piping
      --raw
503
                                  into grep or awk
```

You can run it with

506 trident summarise -d ... -d ...

which will show you context information like – among others – the number of individuals in the dataset, their sex distribution, the mean age of the samples (for ancient data) or the mean coverage on the 1240K SNP array in a table. summarise depends on complete .janno files and will silently ignore missing information for some statistics.

You can use the --raw option to output the summary table in a simple, tab-delimited layout.

# 2 4.3 Survey command

- survey tries to indicate package completeness (mostly focused on .janno files) for poseidon datasets.
- 514 Click here for command line details
- 515 Usage: trident survey (-d|--baseDir DIR) [--raw]
- Survey the degree of context information completeness for Poseidon packages
- 518 Available options:
- 519 -h,--help Show this help text
- 520 -d,--baseDir DIR a base directory to search for Poseidon Packages
- (could be a Poseidon repository)
- 522 --raw output table as tsv without header. Useful for piping
- into grep or awk
- 524 Running

517

- 525 trident survey -d ... -d ...
- will yield a table with one row for each package. See trident survey -h for a legend which cell of this table
- means what.
- Again you can use the --raw option to output the survey table in a tab-delimited format.

# 529 4.4 Validate command

- validate checks poseidon datasets for structural correctness.
- 531 Click here for command line details
- Usage: trident validate (-d|--baseDir DIR) [--verbose]
- $_{\rm 533}$  Check one or multiple Poseidon packages for structural correctness
- 535 Available options:
- 536 -h,--help Show this help text
- of a base directory to search for Poseidon Packages
  - (could be a Poseidon repository)
- $_{539}$  --verbose print more output to the command line
- 540 --ignoreGeno ignore SNP and GenoFile
- $^{541}$  --noExitCode do not produce an explicit exit code
- You can run it with

549

- 543 trident validate -d ... -d ...
- and it will either report a success (Validation passed) or failure with specific error messages to simplify fixing the issues.
- validate tries to ensure that each package in the dataset adheres to the schema definition. Here is a list of
  what is checked:
  - Presence of the necessary files
  - Full structural correctness of .bib and .janno file

- Superficial correctness of genotype data files. A full check would be too computationally expensive
- Correspondence of BibTeX keys in .bib and .janno
- Correspondence of individual and group IDs in .janno and genotype data files

In fact much of this validation already runs as part of the general package reading pipeline invoked for many trident subcommands (e.g. forge). validate is meant to be more thorough, though, and will explicitly fail if even a single package is broken.

# 556 5 Analysis commands

550

551

552

All analysis commands (e.g. trident fstats) have been moved from trident to the analysis tool xerxes.
