21	1	$\mathbf{\Gamma}$	The trident CLI			
22	Tr	ident	is a command line softv	ware tool structured in multiple subcommands. If you installed it properly y	you	
23	ca	n call	l it on the command line	e by typing trident. This will show an overview of the general options and	all	
24	su	bcom	mands, which are explain	ned in detail below.		
25	Us	age:	trident [version]	[logMode ARG] [errLength ARG] (COMMAND COMMAND)		
26	trident is a management and analysis tool for Poseidon packages. Report issues					
27		here	: https://github.com	/poseidon-framework/poseidon-hs/issues		
28						
29	Av	aila	ble options:			
30		-h,-	-help	Show this help text		
31		ve	rsion	Show version number		
32		lo	gMode ARG	How information should be reported: NoLog, SimpleLog,		
33				DefaultLog, ServerLog or VerboseLog		

34 (default: DefaultLog)

35 --errLength ARG After how many characters should a potential error

message be truncated. "Inf" for no truncation.

(default: CharCount 1500)

38

43

45

36

39 Package creation and manipulation commands:

init Create a new Poseidon package from genotype data
fetch Download data from a remote Poseidon repository
forge Select packages, groups or individuals and create a

new Poseidon package from them

44 genoconvert Convert the genotype data in a Poseidon package to a

different file format

update Update POSEIDON.yml files automatically

47

50

51

52

54

57

60

61

62

63

65

48 Inspection commands:

list List packages, groups or individuals from local or

remote Poseidon repositories

summarise Get an overview over the content of one or multiple

Poseidon packages

summarize Synonym for summarise

survey Survey the degree of context information completeness

for Poseidon packages

56 validate Check one or multiple Poseidon packages for

structural correctness

For all subcommands the general argument --logMode defines how trident reports messages (to stderr) on the command line:

- NoLog: Hides all messages.
- SimpleLog: Plain and simple output to stderr.
- DefaultLog: Adds severity indicators before each message. (default setting)
- ServerLog: Additionally adds timestamps before each message.
 - VerboseLog: Shows not just messages on the log levels Info, Warning and Error like the other modes, but also on the more verbose level Debug. Use this for debugging.

66 1.1 Handling data with trident

- ⁶⁷ Trident allows to work directly with genotype data (see -p below), but its optimized for the interaction with
- Poseidon packages, which wrap and contextualize the data. Most trident subcommands therefore have a central
- parameter, called --baseDir or simply -d to specify one or more base directories to look for packages. For example,
- 170 if all Poseidon packages live inside a repository at /path/to/poseidon/packages you would simply say trident
- 71 <subcommand> -d /path/to/poseidon/dirs/ and trident would automatically search all subdirectories inside
- of the repository for valid Poseidon packages (as identified by valid POSEIDON.yml files).
- You can arrange a poseidon repository in a hierarchical way. For example:
- 74 /path/to/poseidon/packages
- 75 /modern

```
/2019_poseidon_package1
76
             /2019_poseidon_package2
77
        /ancient
78
             /...
             /...
80
        /Reference_Genomes
81
             /...
82
             /...
83
    You can use this structure to select only the level of packages you're interested in, even individual ones, and you
    can make use of the fact that -d can be given multiple times.
85
    Being able to specify one or multiple repositories is often not enough, as you may have your own data to
86
    co-analyse with the main repository. This is easy to do, as you simply need to provide your own genotype data as
    yet another Poseidon package to be added to your trident command. For example, let's say you have genotype
88
    data in EIGENSTRAT format (trident supports EIGENSTRAT and PLINK as formats.):
89
    ~/my_project/my_project.geno
    ~/my_project/my_project.snp
91
    ~/my_project/my_project.ind
92
    then you can make that to a skeleton Poseidon package with the init command. You can also do it manually by
93
    simply adding a POSEIDON.yml file, with for example the following content:
    poseidonVersion: 2.5.0
    title: My_awesome_project
96
    description: Unpublished genetic data from my awesome project
97
    contributor:
      - name: Stephan Schiffels
99
        email: schiffels@institute.org
100
    packageVersion: 0.1.0
101
    lastModified: 2020-10-07
102
    genotypeData:
103
      format: EIGENSTRAT
104
      genoFile: my_project.geno
105
      snpFile: my_project.snp
106
      indFile: my_project.ind
107
    jannoFile: my_project.janno
108
    bibFile: sources.bib
109
    Two remarks: 1) all file paths are considered relative to the directory in which POSEIDON.yml resides. Here we
    assume that you put this file into the same directory as the three genotype files. 2) Besides the genotype data
111
    files there are two (technically optional) files referenced by this example POSEIDON.yml file: sources.bib and
112
    my_project.janno. Of course you can add them manually - init automatically creates empty dummy versions.
113
    Once you have set up your own "Poseidon" package (which is really only a skeleton so far), you can add it to
114
    your trident analysis, by simply adding your project directory to the command using -d, for example:
115
    trident list -d /path/to/poseidon/packages/modern \
116
      -d /path/to/poseidon/packages/ReferenceGenomes
```

1.2 Notes on duplicates

119

120

121

122

123

124

125

126

127

128

131

136 137

- If multiple packages in a package repository share the same title, then trident will try to select the one with the highest version number. If this is not sufficient to resolve the conflict, trident will stop.
- Individual/sample names (Poseidon_IDs) within one package have to be unique, or trident will stop.
- We generally also discourage ID duplicates across packages in package repositories, but trident will generally continue with them after printing a warning. This does not apply for validate, by default (you can change this behaviour with --ignoreDuplicates), and forge offers a special mechanism to resolve duplicates within its selection language (see below).

2 Package creation and manipulation commands

2.1 Init command

init creates a new, valid Poseidon package from genotype data files. It adds a valid POSEIDON.yml file, a dummy .janno file for context information and an empty .bib file for literature references.

Click here for command line details

```
Usage: trident init ((-p|--genoOne ARG) | --inFormat ARG --genoFile ARG
--snpFile ARG --indFile ARG) [--snpSet ARG]

(-o|--outPackagePath ARG) [-n|--outPackageName ARG]

[--minimal]
```

Create a new Poseidon package from genotype data

```
138 Available options:
```

```
-h,--help
                                Show this help text
139
     -p,--genoOne ARG
                                one of the input genotype data files. Expects .bed or
140
                                .bim or .fam for PLINK and .geno or .snp or .ind for
141
                                EIGENSTRAT. The other files must be in the same
142
                                directory and must have the same base name
143
     --inFormat ARG
                                the format of the input genotype data: EIGENSTRAT or
144
                                PLINK (only necessary for data input with --genoFile
145
                                + --snpFile + --indFile)
146
     --genoFile ARG
                                the input geno file path
147
     --snpFile ARG
                                the input snp file path
148
     --indFile ARG
                                the input ind file path
149
     --snpSet ARG
                                the snpSet of the package: 1240K, HumanOrigins or
150
                                Other. (only relevant for data input with
151
                                -p|--genoOne or --genoFile + --snpFile + --indFile,
152
                                because the packages in a -d|--baseDir already have
153
                                this information in their respective POSEIDON.yml
                                files) Default: Other
155
     -o,--outPackagePath ARG
                                the output package directory path
156
     -n, -- outPackageName ARG
                                the output package name - this is optional: If no
157
```

```
name is provided, then the package name defaults to
158
                                  the basename of the (mandatory) --outPackagePath
159
                                   argument
160
      --minimal
                                   should only a minimal output package be created?
161
   The command
162
   trident init \
163
      --inFormat EIGENSTRAT/PLINK \
164
      --genoFile path/to/geno_file \
165
      --snpFile path/to/snp_file \
166
      --indFile path/to/ind_file \
167
      --snpSet 1240K|HumanOrigins|Other \
168
      -o path/to/new_package_name
   requires the format (--inFormat) of your input data (either EIGENSTRAT or PLINK), the paths to the respective
170
   files (--genoFile, --snpFile, --indFile), and optionally the "shape" of these files (--snpSet), so if they cover
171
   the 1240K, the HumanOrigins or an Other SNP set. A simpler interface added in trident 0.29.0 is available with
172
    -p (+ --snpSet).
173
```

	EIGENSTRAT	PLINK
genoFile	.geno	.bed
${\rm snpFile}$.snp	$. \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\$
$\operatorname{indFile}$.ind	.fam

The output package of init is created as a new directory -o, which should not already exist, and gets the 174 package title corresponding to the basename of -o. You can also set the title explicitly with -n. The --minimal 175 flag causes init to create a minimal package with a very basic POSEIDON.yml and no .bib and .janno files. 176

2.2Fetch command 177

192

fetch allows to download Poseidon packages from a remote Poseidon server. Read more about this repository here. 179

Click here for command line details 180

```
Usage: trident fetch (-d|--baseDir DIR)
                          (--downloadAll |
182
                            (--fetchFile ARG | (-f|--fetchString ARG)))
183
                          [--remoteURL ARG] [-u|--upgrade]
     Download data from a remote Poseidon repository
185
186
   Available options:
      -h,--help
                                Show this help text
188
      -d,--baseDir DIR
                                a base directory to search for Poseidon Packages
189
                                (could be a Poseidon repository)
190
      --downloadAll
                                download all packages the server is offering
191
      --fetchFile ARG
                                A file with a list of packages. Works just as -f, but
```

```
multiple values can also be separated by newline, not
193
                                   just by comma. -f and --fetchFile can be combined.
194
      -f,--fetchString ARG
                                  List of packages to be downloaded from the remote
195
                                   server. Package names should be wrapped in asterisks:
196
                                   *package_title*. You can combine multiple values with
197
                                   comma, so for example: "*package_1*, *package_2*,
198
                                   *package_3*". fetchString uses the same parser as
199
                                   forgeString, but does not allow excludes. If groups
200
                                   or individuals are specified, then packages which
201
                                   include these groups or individuals are included in
202
                                   the download.
203
      --remoteURL ARG
                                   URL of the remote Poseidon server
204
                                   (default: "https://c107-224.cloud.gwdg.de")
      -u,--upgrade
                                   overwrite outdated local package versions
206
   It works with
207
    trident fetch -d ... -d ... \
208
      -f "*package_title_1*,*package_title_2*,*package_title_3*,group_name,<Individual1>"
209
   and the entities you want to download must be listed either in a simple string of comma-separated values, which
210
    can be passed via -f/--fetchString, or in a text file (--fetchFile). Entities are then combined from these
211
   sources.
212
    Entities are specified using a special syntax (see also the documentation of forge below): Package titles are
213
    wrapped in asterisks: package title, group names are spelled as is, and individual names are wrapped in angular
214
    brackets, liks <Individual1>. Fetch will figure out which packages need to be downloaded to include all specified
215
    entities. --downloadAll, which can be given instead of -f and --fetchFile, causes fetch to download all
216
    packages from the server. The downloaded packages are added in the first (!) -d directory (which gets created
217
   if it doesn't exist), but downloads are only performed if the respective packages are not already present in an
218
    up-to-date version in any of the -d dirs.
219
    Note that trident fetch makes most sense in combination with trident list --remote: First one can inspect
220
    what is available on the server, then one can create a custom fetch command.
221
    fetch also has the optional arguments --remote https:://..." to name an alternative poseidon server. The
222
    default points to the DAG server.
223
   To overwrite outdated package versions with fetch, the -u/--upgrade flag has to be set. Note that many file
224
```

2.3 Forge command

225

226

forge creates new Poseidon packages by extracting and merging packages, populations and individuals from your Poseidon repositories.

Click here for command line details

systems do not offer a way to recover overwritten files. So be careful with this switch.

```
[--forgeFile ARG | (-f|--forgeString ARG)]
                          [--selectSnps ARG] [--intersect] [--outFormat ARG]
234
                          [--minimal] [--onlyGeno] (-o|--outPackagePath ARG)
235
                          [-n|--outPackageName ARG] [--no-extract]
236
     Select packages, groups or individuals and create a new Poseidon package from
237
      them
238
239
   Available options:
240
     -h,--help
                                Show this help text
241
     -d,--baseDir DIR
                                a base directory to search for Poseidon Packages
242
                                (could be a Poseidon repository)
243
     -p,--genoOne ARG
                                one of the input genotype data files. Expects .bed or
244
                                .bim or .fam for PLINK and .geno or .snp or .ind for
                                EIGENSTRAT. The other files must be in the same
246
                                directory and must have the same base name
247
      --inFormat ARG
                                the format of the input genotype data: EIGENSTRAT or
248
                                PLINK (only necessary for data input with --genoFile
249
                                + --snpFile + --indFile)
250
                                the input geno file path
     --genoFile ARG
251
      --snpFile ARG
                                the input snp file path
252
      --indFile ARG
                                the input ind file path
253
      --snpSet ARG
                                the snpSet of the package: 1240K, HumanOrigins or
                                Other. (only relevant for data input with
255
                                -p|--genoOne or --genoFile + --snpFile + --indFile,
256
                                because the packages in a -d|--baseDir already have
                                this information in their respective POSEIDON.yml
258
                                files) Default: Other
259
                                A file with a list of packages, groups or individual
      --forgeFile ARG
260
                                samples. Works just as -f, but multiple values can
261
                                also be separated by newline, not just by comma.
262
                                Empty lines are ignored and comments start with "#",
263
                                so everything after "#" is ignored in one line.
264
                                Multiple instances of -f and --forgeFile can be
265
                                given. They will be evaluated according to their
266
                                input order on the command line.
267
     -f,--forgeString ARG
                                List of packages, groups or individual samples to be
268
                                combined in the output package. Packages follow the
269
                                syntax *package_title*, populations/groups are simply
270
                                group_id and individuals <individual_id>. You can
271
                                combine multiple values with comma, so for example:
                                "*package_1*, <individual_1>, <individual_2>,
273
                                group_1". Duplicates are treated as one entry.
274
                                Negative selection is possible by prepending "-" to
275
                                the entity you want to exclude (e.g. "*package 1*,
276
                                -<individual_1>, -group_1"). forge will apply
277
```

excludes and includes in order. If the first entity 278 is negative, then forge will assume you want to merge 279 all individuals in the packages found in the baseDirs 280 (except the ones explicitly excluded) before the 281 exclude entities are applied. An empty forgeString 282 (and no --forgeFile) will therefore merge all 283 available individuals. If there are individuals in your input packages with equal individual id, but 285 different main group or source package, they can be 286 specified with the special syntax 287 "<package:group:individual>". 288 --selectSnps ARG To extract specific SNPs during this forge operation, 289 provide a Snp file. Can be either Eigenstrat (file ending must be '.snp') or Plink (file ending must be 291 '.bim'). When this option is set, the output package 292 will have exactly the SNPs listed in this file. Any SNP not listed in the file will be excluded. If 294 option '--intersect' is also set, only the SNPs 295 overlapping between the SNP file and the forged packages are output. 297 --intersect Whether to output the intersection of the genotype 298 files to be forged. The default (if this option is not set) is to output the union of all SNPs, with 300 genotypes defined as missing in those packages which 301 do not have a SNP that is present in another package. With this option set, the forged dataset will 303 typically have fewer SNPs, but less missingness. 304 --outFormat ARG the format of the output genotype data: EIGENSTRAT or 305 PLINK. Default: PLINK 306 should only a minimal output package be created? --minimal 307 --onlyGeno should only the resulting genotype data be returned? 308 This means the output will not be a Poseidon package 309 -o,--outPackagePath ARG the output package directory path 310 the output package name - this is optional: If no -n, -- outPackageName ARG 311 name is provided, then the package name defaults to 312 the basename of the (mandatory) --outPackagePath 313 argument 314 --no-extract Skip the selection step in forge. This will result in 315 outputting all individuals in the relevant packages, 316 and hence a superset of the requested 317 individuals/groups. It may result in better 318 performance in cases where one wants to forge entire 319 packages or almost entire packages. Note that this 320 will also ignore any ordering in the output groups/individuals. With this option active,

```
individuals from the relevant packages will just be
323
                                  written in the order that they appear in the original
324
                                  packages.
325
    forge can be used with
326
    trident forge -d ... -d ... \
327
      -f "*package_name*, group_id, <individual_id>" \
328
      -o path/to/new_package_name
329
   where the entities (packages, groups/populations, individuals/samples) you want in the output package can be
330
    denoted either as a string on the command line (-f/--forgeString), or in an input text file (--forgeFile).
331
   See the section below for the syntax of this selection language. Do not forget to wrap the --forgeString query
332
   in quotes.
333
   Including one or multiple Poseidon packages with -d is not the only way to include data for a forge operation.
334
   It is also possible to consider unpackaged genotype data directly with -p (+ --snpSet) or --inFormat +
335
    --genoFile + --snpFile + --indFile (+ --snpSet). This makes the following example possible, where we
336
    merge data from one Poseidon package and two genotype datasets to get a new EIGENSTRAT dataset.
337
    trident forge \
338
      -d 2017_GonzalesFortesCurrentBiology \
339
      -p 2018_VeeramahPNAS/2018_VeeramahPNAS.fam \
340
      --inFormat PLINK \
341
      --genoFile 2017_HaberAJHG/2017_HaberAJHG.bed \
342
      --snpFile 2017_HaberAJHG/2017_HaberAJHG.bim \
343
      --indFile 2017_HaberAJHG/2017_HaberAJHG.fam \
344
      -f "<STR241.SG>,<ERS1790729.SG>,Iberia_HG.SG" \
345
      -o testpackage \
346
```

2.3.1 The forge selection language

--outFormat EIGENSTRAT \

--onlyGeno

347

348

349

355

357

358

360

361

363

The text in --forgeString and --forgeFile are parsed as a domain specific query language that describes precisely which entities should be compiled in the output package of a given forge operation. The language has multiple syntactic elements and a specific evaluation logic.

In general a --forgeString query consists of multiple entities, separated by ,. The main entities are Poseidon packages, groups/populations and individuals/samples:

- Each package title is surrounded by *: *package*. That means if you want all individuals of the Poseidon package 2019_Jeong_InnerEurasia in the output package you would add *2019_Jeong_InnerEurasia* to the query.
- Groups/populations are not specially marked: group. So to get all individuals of the group Swiss_Roman_period, you would simply add Swiss_Roman_period.
- Individuals/samples are surrounded by < and >: <individual>. ALAO26 therefore becomes <ALAO26>. A second way to denote individuals is with the more verbose and specific syntax <package:group:individual>. Such defined individuals take precedence over differently defined ones (so: directly with <individual> or as a subset of *package* or group). This allows to resolve duplication issues precisely at least in cases

where the duplicated individuals differ in source package or primary group.

In the --forgeFile each line is treated as a separate forgeString, empty lines are ignored and #s start comments.

So this is a valid forgeFile:

367 # Packages

package1, *package2*

369 370

Groups and individuals from other packages beyond package1 and package2

group1, <individual1>, group2, <individual2>, <individual3>

372 373

group2 has two outlier individuals that should be ignored

374 -<bad_individual1> # This one has very low coverage

375 -<bad_individual2> # This one is from a different time period

By prepending - to the bad individuals, we can exclude them from the forged package. forge figures out the final list of samples to include by executing all forge-entities in order. So an entity list

PackageA, -<Individual1>, GroupA may result in a different outcome than *PackageA*, GroupA, -<Individual1>,

depending on whether <Individual1> belongs to GroupA or not. If the forge entity list starts with a negative

entity, or if the entity list is empty, forge will implicitly assume you want to include all individuals in all

packages found in the baseDirs (except the ones explicitly excluded, of course).

An empty forgeString will therefore merge all available individuals.

2.3.2 Treatment of the .janno file while merging

forge merges and subsets .janno files along with the genotype data. If a package lacks a .janno file, then a basic one will be created internally based on the information in the genotype data, and used for the output. Missing columns across packages will be filled with n/a.

For merging two .janno files **A** and **B** the following rules apply regarding undefined, arbitrary additional columns:

- If A has an additional column which is not in B then empty cells in the rows imported from B are filled with n/a.
- If **A** and **B** share additional columns with identical column name, then they are treated as semantically identical units and merged accordingly.
- In the resulting .janno file, all additional columns from both **A** and **B** are sorted alphabetically and appended after the normal, specified variables.

The following example illustrates the described behaviour:

395 A.janno

388

389

390

391

392

393

Poseidon_ID	${\tt Group_Name}$	${\rm Genetic_Sex}$	AdditionalColumn1	${\bf Additional Column 2}$
XXX011	POP1	M	A	D
XXX012	POP2	F	В	E
XXX013	POP1	M	C	F

396 B.janno

Poseidon_ID	Group_Name	Genetic_Sex	AdditionalColumn3	AdditionalColumn2
YYY022	POP5	F	G	J
YYY023	POP5	F	H	K
YYY024	POP5	\mathbf{M}	I	L

$_{397}$ A.janno + B.janno

Poseidon_ID	Group_Name	Genetic_Sex	AdditionalColumn1	AdditionalColumn2	AdditionalColumn3
XXX011	POP1	M	A	D	n/a
XXX012	POP2	F	В	E	n/a
XXX013	POP1	M	\mathbf{C}	F	n/a
YYY022	POP5	F	n/a	J	G
YYY023	POP5	F	n/a	K	H
YYY024	POP5	M	n/a	${f L}$	I

$_{98}$ 2.3.3 Other options

- Just as for init the output package of forge is created as a new directory -o. The title can also be explicitly defined with -n.
- --minimal allows for the creation of a minimal output package without .bib and .janno. This is especially
 useful for data analysis pipelines, where only the genotype data is required. Even more basic output comes with
 --onlyGeno, which means that only the genotype data is returned without any Poseidon package.
- forge has a an optional flag --intersect, that defines, if the genotype data from different packages should be merged with an **union** or an **intersect** operation. The default (if this option is not set) is to output the union of all SNPs, with genotypes defined as missing in samples from packages which do not have a SNP that is present in another package. With this option set, on the other hand, the forged dataset will typically have fewer SNPs, but less missingness.
- --intersect also influences the automatic determination of the snpSet field in the POSEIDON.yml file for the resulting package. If the snpSets of all input packages are identical, then the resulting package will just inherit this configuration. Otherwise forge applies the following pairwise merging logic:

Input snpSet A	Input snpSet B	intersect	Ouput snpSet
Other	*	*	Other
1240K	HumanOrigins	True	HumanOrigins
1240K	HumanOrigins	False	1240K

--selectSnps allows to provide forge with a SNP file in EIGENSTRAT (.snp) or PLINK (.bim) format to create a package with a specific selection. When this option is set, the output package will have exactly the SNPs listed in this file. Any SNP not listed in the file will be excluded. If --intersect is also set, only the SNPs overlapping between the SNP file and the forged packages are output.

Merging genotype data across different data sources and file formats is tricky. forge is more verbose about potential issues, if the --logMode flag is set to VerboseLog.

The --onlyGeno command specifies that only genotype data should be output, not an entire Poseidon package.

2.4 Genoconvert command

Click here for command line details

419

422

genoconvert converts the genotype data in a Poseidon package to a different file format. The respective entries in the POSEIDON.yml file are changed accordingly.

```
Usage: trident genoconvert ((-d|--baseDir DIR) |
423
                                  ((-p|--genoOne ARG) | --inFormat ARG --genoFile ARG
424
                                    --snpFile ARG --indFile ARG) [--snpSet ARG])
425
                                --outFormat ARG [--onlyGeno]
426
                                [-o|--outPackagePath ARG] [--removeOld]
427
     Convert the genotype data in a Poseidon package to a different file format
428
429
   Available options:
430
     -h,--help
                                Show this help text
431
     -d,--baseDir DIR
                                a base directory to search for Poseidon Packages
432
                                (could be a Poseidon repository)
433
     -p,--genoOne ARG
                                one of the input genotype data files. Expects .bed or
434
                                .bim or .fam for PLINK and .geno or .snp or .ind for
                                EIGENSTRAT. The other files must be in the same
436
                                directory and must have the same base name
437
     --inFormat ARG
                                the format of the input genotype data: EIGENSTRAT or
438
                                PLINK (only necessary for data input with --genoFile
439
                                + --snpFile + --indFile)
440
                                the input geno file path
     --genoFile ARG
441
     --snpFile ARG
                                the input snp file path
442
     --indFile ARG
                                the input ind file path
443
     --snpSet ARG
                                the snpSet of the package: 1240K, HumanOrigins or
                                Other. (only relevant for data input with
445
                                -p|--genoOne or --genoFile + --snpFile + --indFile,
446
                                because the packages in a -d|--baseDir already have
                                this information in their respective POSEIDON.yml
448
                                files) Default: Other
449
     --outFormat ARG
                                the format of the output genotype data: EIGENSTRAT or
450
                                PLINK.
451
     --onlyGeno
                                should only the resulting genotype data be returned?
452
                                This means the output will not be a Poseidon package
     -o,--outPackagePath ARG
                                the output package directory path - this is optional:
454
```

(.bed/.geno) is stored

ones

With the default setting

--removeOld

455

457

458

If no path is provided, then the output is written to

the directories where the input genotype data file

Remove the old genotype files when creating the new

```
trident genoconvert -d ... -d ... --outFormat EIGENSTRAT|PLINK
   all packages in -d will be converted to the desired --outFormat (either EIGENSTRAT or PLINK), if the data is
462
   not already in this format. This includes updating the respective POSEIDON.yml files.
   The "old" data is not deleted, but kept around. That means conversion can result in a package with both PLINK
464
   and EIGENSTRAT data, but only one is linked in the POSEIDON.yml file, and that is what will be used by
465
   trident. To delete the old data in the conversion you can add the --removeOld flag.
   Instead of -d to change Poseidon packages, the -p (+ --snpSet) or --inFormat + --genoFile + --snpFile
467
   + --indFile (+ --snpSet) allow to directly convert genotype data that is not wrapped in a Poseidon package
   and store it to a directory given in -o. See this example:
469
   trident genoconvert \
470
      -p 2018_Mittnik_Baltic/Mittnik_Baltic.bed \
471
      --outFormat EIGENSTRAT
472
      -o my_directory
473
          Update command
   2.5
474
   update automatically harmonizes POSEIDON.yml files of one or multiple packages if the packages were changed.
475
   This is not an automatic update from one Poseidon version to the next!
476
   Click here for command line details
   Usage: trident update (-d|--baseDir DIR) [--poseidonVersion ARG]
478
                            [--ignorePoseidonVersion] [--versionComponent ARG]
470
                            [--noChecksumUpdate] [--newContributors ARG]
480
                            [--logText ARG] [--force]
481
     Update POSEIDON.yml files automatically
483
   Available options:
484
      -h,--help
                                 Show this help text
      -d,--baseDir DIR
                                 a base directory to search for Poseidon Packages
486
                                  (could be a Poseidon repository)
487
                                 Poseidon version the packages should be updated to:
      --poseidonVersion ARG
                                 e.g. "2.5.3" (default: Nothing)
489
                                 Read packages even if their poseidonVersion is not
      --ignorePoseidonVersion
490
                                 compatible with the trident version. The assumption
                                 is, that the package is already structurally adjusted
                                 to the trident version and only the version number is
493
                                 lagging behind.
                                 Part of the package version number in the
      --versionComponent ARG
                                 POSEIDON.yml file that should be updated: Major,
496
                                 Minor or Patch (see https://semver.org)
497
                                  (default: Patch)
      --noChecksumUpdate
                                 Should update of checksums in the POSEIDON.yml file
499
                                 be skipped
500
                                 ignore SNP and GenoFile
      --ignoreGeno
```

```
Contributors to add to the POSEIDON.yml file in the
      --newContributors ARG
502
                                form "[Firstname Lastname] (Email address);..."
503
      --logText ARG
                                Log text for this version jump in the CHANGELOG file
504
                                (default: "not specified")
505
      --force
                                Normally the POSEIDON.yml files are only changed if
506
                                the poseidonVersion is adjusted or any of the
                                checksums change. With --force a package version
508
                                update can be triggered even if this is not the case.
509
```

 $_{510}$ It can be called with a lot of optional arguments

```
trident update -d ... -d ... \
511
      --poseidonVersion "X.X.X" \
512
      --versionComponent Major/Minor/Patch \
513
      --noChecksumUpdate
514
      --ignoreGeno
515
      --newContributors "[Firstname Lastname] (Email address);..."
516
      --logText "short description of the update"
517
      --force
518
```

By default update will not edit a package's POSEIDON.yml file, even when arguments like --versionComponent,
--newContributors or --logText are explicitly set. This default exists to run the function on a large set of
packages where only few of them were edited and need an active update. A package will only be modified by
update if either

- any of the files with checksums (e.g. the genotype data) in it were modified,
- the --poseidonVersion argument differs from the poseidonVersion in the package's POSEIDON.yml file
- or the --force flag was set in update.

523

524

525

526

529

531

532

534

535

536

537

538

539

540

541

If any of these applies to a package in the search directory (--baseDir/-d), it will be updated. This includes the following steps:

- If --poseidonVersion is different from the poseidonVersion field in the package, then that will be updated.
- The packageVersion will be incremented. If --versionComponent is not set, then it falls back to Patch, so a change in the last position of the three digit version number. Minor increments the middle, and Major the first position (see semantic versioning).
- The lastModified field will be updated to the current day (based on your computer's system time).
- The contributors in --newContributors will be added to the contributor field if they're not there already.
- If any checksums changed, then they will be updated. If certain checksums are not set yet, then they will be added. The checksum update can be skipped with --noChecksumUpdate or partially skipped for the genotype data with --ignoreGeno.
- The CHANGELOG.md file will be updated with a new row for the new version and the text in --logText (default: "not specified"), which will be appended as the first line of the file. If no CHANGELOG.md file exists, then it will be created and referenced in the POSEIDON.yml file.

542 :heavy_exclamation_mark: As update reads and rewrites POSEIDON.yml files, it may change their inner order,
 543 layout or even content (e.g. if they have fields which are not in the Poseidon package definition). Create a backup
 544 of the POSEIDON.yml file before running update if you are uncertain.

Inspection commands 3

List command 3.1

547

```
list lists packages, groups and individuals of the datasets you use, or of the packages available on the server.
   Click here for command line details
   Usage: trident list ((-d|--baseDir DIR) | --remote [--remoteURL ARG])
549
                     (--packages | --groups | --individuals
550
                       [-j|--jannoColumn JANNO_HEADER]) [--raw]
551
     List packages, groups or individuals from local or remote Poseidon
552
     repositories
553
554
   Available options:
555
     -h,--help
                            Show this help text
556
     -d,--baseDir DIR
                            a base directory to search for Poseidon Packages
                            (could be a Poseidon repository)
558
     --remote
                            list packages from a remote server instead the local
559
                            file system
     --remoteURL ARG
                            URL of the remote Poseidon server
561
                            (default: "https://c107-224.cloud.gwdg.de")
562
                            list all packages
     --packages
     --groups
                            list all groups, ignoring any group names after the
564
                            first as specified in the Janno-file
565
     --individuals
                            list individuals
     -j,--jannoColumn JANNO_HEADER
567
                            list additional fields from the janno files, using
568
                            the Janno column heading name, such as Country, Site,
                            Date_C14_Uncal_BP, Endogenous, ...
570
                            output table as tsv without header. Useful for piping
     --raw
571
                            into grep or awk
572
     --ignoreGeno
                            ignore SNP and GenoFile
573
   To list packages from your local repositories, as seen above you can run
574
   trident list -d ... -d ... --packages
   This will yield a table like this
576
    ______,___,__,
                    Title
                                          1
                                                     | Nr Individuals |
                                              Date
578
   579
   581
   | 2018_BostonDatashare_modern_published
                                          | 2020-08-10 | 2772
582
                                          1 ...
```

so a nicely formatted table of all packages, their last update and the number of individuals in it.

- To view packages on the remote server, instead of using directories to specify the locations of repositories on your system, you can use --remote to show packages on the remote server. For example
- 588 trident list --packages --remote
- will result in a view of all published packages in our public online repository.
- $_{590}$ You can also list groups, as defined in the third column of EIGENSTRAT .ind files (or the first column of a
- PLINK .fam file), and individuals with --groups and --individuals instead of --packages.
- The --individuals flag provides a way to immediately access information from the .janno files on the
- command line. This works with the -j/--jannoColumn option. For example adding --jannoColum Country
- --jannoColumn Date_C14_Uncal_BP to the commands above will add the Country and the Date_C14_Uncal_BP
- columns to the respective output tables.
- Note that if you want a less fancy table, for example because you want to load this into Excel, or pipe into
- another command that cannot deal with the neat table layout, you can use the --raw option to output that
- table as a simple tab-delimited stream.

599 3.2 Summarise command

- 500 summarise prints some general summary statistics for a given poseidon dataset taken from the .janno files.
- 601 Click here for command line details
- 602 Usage: trident summarise (-d|--baseDir DIR) [--raw]
- 603 Get an overview over the content of one or multiple Poseidon packages
- 605 Available options:
- 606 -h,--help Show this help text
- on -d,--baseDir DIR a base directory to search for Poseidon Packages
- (could be a Poseidon repository)
- output table as tsv without header. Useful for piping
- into grep or awk
- You can run it with
- $_{612}$ trident summarise -d ... -d ...
- which will show you context information like among others the number of individuals in the dataset, their
- sex distribution, the mean age of the samples (for ancient data) or the mean coverage on the 1240K SNP array
- in a table. summarise depends on complete janno files and will silently ignore missing information for some
- 616 statistics.
- You can use the --raw option to output the summary table in a simple, tab-delimited layout.

518 3.3 Survey command

- 619 survey tries to indicate package completeness (mostly focused on .janno files) for poseidon datasets.
- 620 Click here for command line details
- 621 Usage: trident survey (-d|--baseDir DIR) [--raw]
- 622 Survey the degree of context information completeness for Poseidon packages

```
623
    Available options:
624
      -h,--help
                                  Show this help text
625
      -d,--baseDir DIR
                                  a base directory to search for Poseidon Packages
626
                                  (could be a Poseidon repository)
627
                                  output table as tsv without header. Useful for piping
      --raw
628
                                  into grep or awk
629
   Running
630
    trident survey -d ... -d ...
631
    will yield a table with one row for each package. See trident survey -h for a legend which cell of this table
632
   means what.
633
    Again you can use the --raw option to output the survey table in a tab-delimited format.
634
          Validate command
    3.4
635
    validate checks poseidon datasets for structural correctness.
    Click here for command line details
637
    Usage: trident validate (-d|--baseDir DIR)
638
      Check one or multiple Poseidon packages for structural correctness
639
640
    Available options:
      -h,--help
                                  Show this help text
642
      -d,--baseDir DIR
                                  a base directory to search for Poseidon Packages
643
                                  (could be a Poseidon repository)
      --ignoreGeno
                                  ignore SNP and GenoFile
645
      --noExitCode
                                  do not produce an explicit exit code
646
      --ignoreDuplicates
                                  do not stop on duplicated individual names in the
                                  package collection
648
    You can run it with
649
    trident validate -d ... -d ...
650
   and it will either report a success (Validation passed) or failure with specific error messages to simplify fixing
651
    the issues.
```

- validate tries to ensure that each package in the dataset adheres to the schema definition. Here is a list of 653
- what is checked: 654
 - Presence of the necessary files

655

656

657

- Full structural correctness of .bib and .janno file
- Superficial correctness of genotype data files. A full check would be too computationally expensive
- Correspondence of BibTeX keys in .bib and .janno 658
 - Correspondence of individual and group IDs in .janno and genotype data files
- In fact much of this validation already runs as part of the general package reading pipeline invoked for many trident subcommands (e.g. forge). validate is meant to be more thorough, though, and will explicitly fail if 661

- even a single package is broken.
- Remember to run it with --logMode VerboseLog to get more information if the output is not sufficient to debug
- an issue.
