19	1	Poseidon package repositories	
20	Tr	rident generally requires Poseidon "packages" to work with (since version 0.28.0 it also supports directly	ct
21	int	teraction with "unpackaged" genotype data – see -p below). Most trident subcommands therefore have	a
22	cei	ntral parameter, calledbaseDir or simply -d to specify one or more base directories to look for package	es
23	Fo	or example, if all Poseidon packages live inside a repository at /path/to/poseidon/packages you would	ld
24	\sin	mply say trident <subcommand> -d /path/to/poseidon/dirs/ and trident would automatically search</subcommand>	ch
25	all	l subdirectories inside of the repository for valid poseidon packages (as identified by valid POSEIDON.ym	1
26	file	es).	
27	Yo	ou can arrange a poseidon repository in a hierarchical way. For example:	
28	/p	eath/to/poseidon/packages	
29		/modern	
30		/2019_poseidon_package1	
31		/2019_poseidon_package2	
32		/ancient	

```
/...
33
            /...
34
       /Reference_Genomes
35
            /...
            /...
37
       /Archaic_Humans
38
            /...
39
            /...
40
   You can use this structure to select only the level of packages you're interested in, and you can make use of the
   fact that -d can be given multiple times.
42
   Let's use the list command to list all packages in the modern and Reference_Genomes:
43
   trident list -d /path/to/poseidon/packages/modern \
     -d /path/to/poseidon/packages/ReferenceGenomes --packages
45
   \mathbf{2}
        Analysing your own dataset outside of the main repository
   Being able to specify one or multiple repositories is often not enough, as you may have your own data to
   co-analyse with the main repository. This is easy to do, as you simply need to provide your own genotype data
   as yet another poseidon package to be added to your trident list command. For example, let's say you have
49
   genotype data in EIGENSTRAT format (trident supports EIGENSTRAT and PLINK as formats.):
50
   ~/my_project/my_project.geno
   ~/my_project/my_project.snp
52
   ~/my_project/my_project.ind
53
   then you can make that to a skeleton Poseidon package with the init command. You can also do it manually
   by simply adding a POSEIDON.yml file, with for example the following content:
55
   poseidonVersion: 2.5.0
   title: My_awesome_project
57
   description: Unpublished genetic data from my awesome project
58
   contributor:
59
     - name: Stephan Schiffels
60
       email: schiffels@institute.org
61
   packageVersion: 0.1.0
   lastModified: 2020-10-07
63
   genotypeData:
64
     format: EIGENSTRAT
65
     genoFile: my_project.geno
     snpFile: my_project.snp
67
     indFile: my_project.ind
   jannoFile: my_project.janno
69
   bibFile: sources.bib
```

Two remarks: 1) all file paths are considered *relative* to the directory in which POSEIDON.yml resides. Here I assume that you put this file into the same directory as the three genotype files. 2) Besides the genotype data

```
files there are two (technically optional) files referenced by this example POSEIDON.yml file: sources.bib
   and my_project.janno. Of course you can add them manually - init automatically creates empty dummy
74
   versions.
75
   Once you have set up your own "Poseidon" package (which is really only a skeleton so far), you can add it to
   your trident analysis, by simply adding your project directory to the command using -d:
77
   trident list -d /path/to/poseidon/packages/modern \
     -d /path/to/poseidon/packages/ReferenceGenomes
     -d ~/my_project --packages
80
```

Package creation and manipulation commands

Init command

init creates a new, valid poseidon package from genotype data files. It adds a valid POSEIDON.yml file, a 83 dummy .janno file for context information and an empty .bib file for literature references.

Click here for command line details

```
Usage: trident init ((-p|--genoOne ARG) | --inFormat ARG --genoFile ARG
86
                          --snpFile ARG --indFile ARG) [--snpSet ARG]
87
                        (-o|--outPackagePath ARG) [-n|--outPackageName ARG]
88
                        [--minimal]
89
```

Create a new Poseidon package from genotype data

```
Available options:
```

```
92
      -h,--help
                                Show this help text
93
      -p,--genoOne ARG
                                one of the input genotype data files. Expects .bed or
                                .bim or .fam for PLINK and .geno or .snp or .ind for
                                EIGENSTRAT. The other files must be in the same
                                directory and must have the same base name
      --inFormat ARG
                                the format of the input genotype data: EIGENSTRAT or
98
                                PLINK (only necessary for data input with --genoFile
qq
                                + --snpFile + --indFile)
100
      --genoFile ARG
                                the input geno file path
101
      --snpFile ARG
                                the input snp file path
102
      --indFile ARG
                                the input ind file path
103
      --snpSet ARG
                                the snpSet of the new package: 1240K, HumanOrigins or
104
                                Other. Default: Other
105
      -o, -- outPackagePath ARG
                                the output package directory path
106
      -n, -- outPackageName ARG
                                the output package name - this is optional: If no
107
                                name is provided, then the package name defaults to
108
                                the basename of the (mandatory) --outPackagePath
109
                                argument
110
      --minimal
                                should only a minimal output package be created?
111
```

The command

```
trident init \
      --inFormat EIGENSTRAT/PLINK \
114
      --genoFile path/to/geno_file \
115
      --snpFile path/to/snp_file \
116
      --indFile path/to/ind_file \
117
      --snpSet 1240K|HumanOrigins|Other \
118
      -o path/to/new_package_name
119
   requires the format ( --inFormat ) of your input data (either EIGENSTRAT or PLINK), the paths to the
120
   respective files ( --genoFile , --snpFile , --indFile ), and optionally the "shape" of these files ( --snpSet ),
121
    so if they cover the 1240K, the HumanOrigins or an Other SNP set. A simpler interface added in trident
122
   0.29.0 is available with -p (+ --snpSet).
123
```

	EIGENSTRAT	PLINK
genoFile	.geno	.bed
${\rm snpFile}$	$.\mathrm{snp}$.bim
$\operatorname{indFile}$.ind	.fam

The output package of init is created as a new directory -o, which should not already exist, and gets the package title corresponding to the basename of -o. You can also set the title explicitly with -n. The --minimal flag causes init to create a minimal package with a very basic POSEIDON.yml and no .bib and .janno files.

128 3.2 Fetch command

129 fetch allows to download poseidon packages from a remote poseidon server.

30 Click here for command line details

Download data from a remote Poseidon repository

```
Available options:
```

135 136

```
-h,--help
                                Show this help text
      -d,--baseDir DIR
                                a base directory to search for Poseidon Packages
139
                                (could be a Poseidon repository)
140
      --downloadAll
                                download all packages the server is offering
141
                                A file with a list of packages. Works just as -f, but
      --fetchFile ARG
                                multiple values can also be separated by newline, not
143
                                just by comma. -f and --fetchFile can be combined.
144
      -f,--fetchString ARG
                                List of packages to be downloaded from the remote
145
                                server. Package names should be wrapped in asterisks:
146
                                *package_title*. You can combine multiple values with
147
                                comma, so for example: "*package_1*, *package_2*,
148
```

```
*package_3*". fetchString uses the same parser as
149
                                   forgeString, but does not allow excludes. If groups
150
                                   or individuals are specified, then packages which
151
                                   include these groups or individuals are included in
152
                                   the download.
153
      --remoteURL ARG
                                   URL of the remote Poseidon server
154
                                   (default: "https://c107-224.cloud.gwdg.de")
155
      -u,--upgrade
                                   overwrite outdated local package versions
156
   It works with
157
    trident fetch -d ... -d ... \
158
      -f "*package_title_1*,*package_title_2*,*package_title_3*,group_name,<Individual1>" \
159
      --fetchFile path/to/forgeFile
160
    and the entities you want to download must be listed either in one or more simple strings with comma-separated
161
    values, which can be passed via one or multiple options -f / --fetchString, or in one or more text files
162
   (--fetchFile). Entities are then combined from these sources. Entities are specified using a special syntax:
163
    Package titles are wrapped in asterisks: package title (see also the documentation of forge below), group
164
    names are spelled as is, and individual names are wrapped in angular brackets, liks <Individual1>. Fetch will
165
    figure out which packages need to be downloaded to include all specified entities. --downloadAll, which can be
166
    given instead of -f and --fetchFile, causes fetch to download all packages from the server. The downloaded
167
    packages are added in the first (!) -d directory (which gets created if it doesn't exist), but downloads are only
168
    performed if the respective packages are not already present in an up-to-date version in any of the -d dirs.
169
   Note that trident fetch makes most sense in combination with trident list --remote: First one can
170
    inspect what is available on the server, then one can create a custom fetch command.
171
    fetch also has the optional arguments --remote https:://..." do name an alternative poseidon server.
172
    The default points to the DAG server.
173
```

3.3 Forge command

175

176

189

forge creates new poseidon packages by extracting and merging packages, populations and individuals from your poseidon repositories.

To overwrite outdated package versions with fetch, the -u / --upgrade flag has to be set. Note that many

179 Click here for command line details

```
Usage: trident forge ((-d|--baseDir DIR) |
180
                            ((-p|--genoOne ARG) | --inFormat ARG --genoFile ARG
181
                              --snpFile ARG --indFile ARG) [--snpSet ARG])
                          [--forgeFile ARG | (-f|--forgeString ARG)]
183
                          [--selectSnps ARG] [--intersect] [--outFormat ARG]
184
                          [--minimal] [--onlyGeno] (-o|--outPackagePath ARG)
185
                          [-n|--outPackageName ARG] [--no-extract]
186
     Select packages, groups or individuals and create a new Poseidon package from
187
     them
188
```

file systems do not offer a way to recover overwritten files. So be careful with this switch.

190	Available options:	
191	-h,help	Show this help text
192	-d,baseDir DIR	a base directory to search for Poseidon Packages
193		(could be a Poseidon repository)
194	-p,genoOne ARG	one of the input genotype data files. Expects .bed or
195		.bim or .fam for PLINK and .geno or .snp or .ind for
196		EIGENSTRAT. The other files must be in the same
197		directory and must have the same base name
198	inFormat ARG	the format of the input genotype data: EIGENSTRAT or
199		PLINK (only necessary for data input withgenoFile
200		+snpFile +indFile)
201	genoFile ARG	the input geno file path
202	snpFile ARG	the input snp file path
203	indFile ARG	the input ind file path
204	snpSet ARG	the snpSet of the new package: 1240K, HumanOrigins or
205		Other. Default: Other
206	forgeFile ARG	A file with a list of packages, groups or individual
207		samples. Works just as -f, but multiple values can
208		also be separated by newline, not just by comma.
209		Empty lines are ignored and comments start with "#",
210		so everything after "#" is ignored in one line.
211		Multiple instances of -f andforgeFile can be
212		given. They will be evaluated according to their
213		input order on the command line.
214	-f,forgeString ARG	List of packages, groups or individual samples to be
215		combined in the output package. Packages follow the
216		<pre>syntax *package_title*, populations/groups are simply</pre>
217		<pre>group_id and individuals <individual_id>. You can</individual_id></pre>
218		combine multiple values with comma, so for example:
219		<pre>"*package_1*, <individual_1>, <individual_2>,</individual_2></individual_1></pre>
220		<pre>group_1". Duplicates are treated as one entry.</pre>
221		Negative selection is possible by prepending "-" to
222		the entity you want to exclude (e.g. "*package_1*,
223		- <individual_1>, -group_1"). forge will apply</individual_1>
224		excludes and includes in order. If the first entity
225		is negative, then forge will assume you want to merge
226		all individuals in the packages found in the baseDirs
227		(except the ones explicitly excluded) before the
228		exclude entities are applied. An empty forgeString
229		(and noforgeFile) will therefore merge all
230	goloctCnmc ADC	available individuals.
231	selectSnps ARG	To extract specific SNPs during this forge operation,
232		provide a Snp file. Can be either Eigenstrat (file
233		ending must be '.snp') or Plink (file ending must be
234		'.bim'). When this option is set, the output package

```
will have exactly the SNPs listed in this file. Any
235
                                 SNP not listed in the file will be excluded. If
236
                                 option '--intersect' is also set, only the SNPs
237
                                 overlapping between the SNP file and the forged
238
                                 packages are output.
239
      --intersect
                                 Whether to output the intersection of the genotype
240
                                 files to be forged. The default (if this option is
241
                                 not set) is to output the union of all SNPs, with
242
                                 genotypes defined as missing in those packages which
243
                                 do not have a SNP that is present in another package.
244
                                 With this option set, the forged dataset will
245
                                 typically have fewer SNPs, but less missingness.
246
      --outFormat ARG
                                 the format of the output genotype data: EIGENSTRAT or
247
                                 PLINK. Default: PLINK
248
      --minimal
                                 should only a minimal output package be created?
249
                                 should only the resulting genotype data be returned?
      --onlyGeno
250
                                 This means the output will not be a Poseidon package
251
      -o, -- outPackagePath ARG
                                 the output package directory path
252
      -n,--outPackageName ARG
                                 the output package name - this is optional: If no
253
                                 name is provided, then the package name defaults to
254
                                 the basename of the (mandatory) --outPackagePath
255
                                 argument
      --no-extract
                                 Skip the selection step in forge. This will result in
257
                                 outputting all individuals in the relevant packages,
258
                                 and hence a superset of the requested
                                 individuals/groups. It may result in better
260
                                 performance in cases where one wants to forge entire
261
                                 packages or almost entire packages. Note that this
262
                                 will also ignore any ordering in the output
263
                                 groups/individuals. With this option active,
264
                                 individuals from the relevant packages will just be
265
                                 written in the order that they appear in the original
266
                                 packages.
267
    forge can be used with
    trident forge -d ... -d ... \
269
      -f "*package_name*, group_id, <individual_id>" \
270
      --forgeFile path/to/forgeFile \
271
      -o path/to/new_package_name
272
   where the entities (packages, groups/populations, individuals/samples) you want in the output package can be
   denoted either as one or more simple strings with comma-separated values via one or more ( -f / --forgeString )
274
   options, or in one or more text files ( --forgeFile ). Because the order in which inclusions and exclusions
275
   are given, the order strictly follows the order as these strings are given via options -f / --forgeString and
276
    --forgeFile.
```

```
--inFormat + --genoFile + --snpFile + --indFile (+ --snpSet) . This makes the following example
280
   possible, where we merge data from one Poseidon package and two genotype datasets to get a new EIGENSTRAT
281
   dataset.
282
    trident forge \
283

      -o testpackage \
291
      --outFormat EIGENSTRAT \
292
      --onlyGeno
           The forge selection language
294
   Entities in the --forgeString or the --forgeFile have to be marked in a certain way:
295
      • Each package is surrounded by *, so if you want all individuals of 2019_Jeong_InnerEurasia in the
296
         output package you would add *2019_Jeong_InnerEurasia* to the list.
297
      • Groups/populations are not specially marked. So to get all individuals of the group Swiss_Roman_period,
         you would simply add Swiss_Roman_period.
299
      • Individuals/samples are surrounded by < and >, so ALA026 becomes <ALA026>.
300
   Do not forget to wrap the forgeString in quotes.
   You can use both -f / --forgeString and --forgeFile and even combine multiple of each. They are
302
   evaluated in order.
303
   In the file each line is treated as a separate forgeString, empty lines are ignored and # s start comments. So this
304
   is a valid forgeFile:
305
   # Packages
    *package1*, *package2*
307
   # Groups and individuals from other packages beyond package1 and package2
   group1, <individual1>, group2, <individual2>, <individual3>
310
311
   # group2 has two outlier individuals that should be ignored
312
   -<bad_individual1> # This one has very low coverage
313
   -<bad_individual2> # This one is from a different time period
314
   By prepending - to the bad individuals, we can exclude them from the forged package. forge fig-
315
   ures out the final list of samples to include by executing all forge-entities in order. So an entity list
316
    *PackageA*,-<Individual1>,GroupA may result in a different outcome than *PackageA*,GroupA,-<Individual1>,
317
```

operation. It is also possible to include unpackaged genotype data directly with -p (+ --snpSet) or

depending on whether <Individual1> belongs to GroupA or not. If the forge entity list starts with a negative

entity, or if the entity list is empty, forge will implicitly assume you want to include all individuals in all

318

packages found in the baseDirs (except the ones explicitly excluded, of course). An empty forgeString will
therefore merge all available individuals.

3.3.2 Other options

322

Just as for init the output package of forge is created as a new directory -o. The title can also be explicitly defined with -n.

--minimal allows for the creation of a minimal output package without .bib and .janno. This might be
especially useful for data analysis pipelines, where only the genotype data is required. Even more basic output
comes with --onlyGeno, which means that only the genotype data is returned without any Poseidon package.

forge has a an optional flag --intersect, that defines, if the genotype data from different packages should
be merged with an union or an intersect operation. The default (if this option is not set) is to output the
union of all SNPs, with genotypes defined as missing in samples from packages which do not have a SNP that is
present in another package. With this option set, on the other hand, the forged dataset will typically have fewer
SNPs, but less missingness.

--intersect also influences the automatic determination of the snpSet field in the POSEIDON.yml file for the resulting package. If the snpSet s of all input packages are identical, then the resulting package will just inherit this configuration. Otherwise forge applies the following pairwise merging logic:

Input snpSet A	Input snpSet B	intersect	Ouput snpSet
Other	*	*	Other
1240K	HumanOrigins	True	HumanOrigins
1240K	HumanOrigins	False	1240K

--selectSnps allows to provide forge with a SNP file in EIGENSTRAT (.snp) or PLINK (.bim) format to create a package with a specific selection. When this option is set, the output package will have exactly the SNPs listed in this file. Any SNP not listed in the file will be excluded. If --intersect is also set, only the SNPs overlapping between the SNP file and the forged packages are output.

Merging genotype data across different data sources and file formats is tricky. forge is more verbose about potential issues, if the --logMode flag is set to VerboseLog.

2 3.4 Genoconvert command

genoconvert converts the genotype data in a Poseidon package to a different file format. The respective entries in the POSEIDON.yml file are changed accordingly.

Click here for command line details

345

```
Usage: trident genoconvert ((-d|--baseDir DIR) |

((-p|--genoOne ARG) | --inFormat ARG --genoFile ARG

--snpFile ARG --indFile ARG) [--snpSet ARG])

--outFormat ARG [--onlyGeno]

[-o|--outPackagePath ARG] [--removeOld]

Convert the genotype data in a Poseidon package to a different file format
```

```
Available options:
353
      -h,--help
                                 Show this help text
354
      -d,--baseDir DIR
                                 a base directory to search for Poseidon Packages
355
                                  (could be a Poseidon repository)
356
      -p,--genoOne ARG
                                 one of the input genotype data files. Expects .bed or
357
                                  .bim or .fam for PLINK and .geno or .snp or .ind for
358
                                 EIGENSTRAT. The other files must be in the same
359
                                 directory and must have the same base name
360
      --inFormat ARG
                                 the format of the input genotype data: EIGENSTRAT or
361
                                 PLINK (only necessary for data input with --genoFile
362
                                 + --snpFile + --indFile)
363
      --genoFile ARG
                                 the input geno file path
364
      --snpFile ARG
                                 the input snp file path
      --indFile ARG
                                 the input ind file path
366
      --snpSet ARG
                                 the snpSet of the new package: 1240K, HumanOrigins or
367
                                 Other. Default: Other
      --outFormat ARG
                                 the format of the output genotype data: EIGENSTRAT or
369
                                 PLINK.
370
      --onlyGeno
                                 should only the resulting genotype data be returned?
371
                                 This means the output will not be a Poseidon package
372
      -o,--outPackagePath ARG
                                 the output package directory path - this is optional:
373
                                 If no path is provided, then the output is written to
                                 the directories where the input genotype data file
375
                                  (.bed/.geno) is stored
376
                                 Remove the old genotype files when creating the new
      --removeOld
377
                                  ones
378
   With the default setting
379
   trident genoconvert -d ... -d ... --outFormat EIGENSTRAT|PLINK
   all packages in -d will be converted to the desired --outFormat (either EIGENSTRAT or PLINK), if the data
381
   is not already in this format. This includes updating the respective POSEIDON.yml files.
   The "old" data is not deleted, but kept around. That means conversion can result in a package with both PLINK
383
   and EIGENSTRAT data, but only one is linked in the POSEIDON yml file, and that is what will be used by
384
   trident. To delete the old data in the conversion you can add the --removeOld flag.
   Instead of -d to change Poseidon packages, the -p (+ --snpSet) or --inFormat + --genoFile + --snpFile + --indFi
386
   allow to directly convert genotype data that is not wrapped in a Poseidon package and store it to a directory
387
   given in -o . See this example:
388
   trident genoconvert \
389
      -p 2018_Mittnik_Baltic/Mittnik_Baltic.bed \
      --outFormat EIGENSTRAT
391
      -o my_directory
```

3.5 Update command

```
update automatically harmonizes POSEIDON.yml files of one or multiple packages if the packages were
394
   changed. This is not an automatic update from one Poseidon version to the next!
395
   Click here for command line details
396
   Usage: trident update (-d|--baseDir DIR) [--poseidonVersion ARG]
                           [--ignorePoseidonVersion] [--versionComponent ARG]
398
                           [--noChecksumUpdate] [--newContributors ARG]
399
                           [--logText ARG] [--force]
      Update POSEIDON.yml files automatically
401
   Available options:
      -h,--help
                                Show this help text
404
      -d,--baseDir DIR
                                a base directory to search for Poseidon Packages
405
                                 (could be a Poseidon repository)
                                Poseidon version the packages should be updated to:
      --poseidonVersion ARG
407
                                e.g. "2.5.3" (default: Nothing)
408
                                Read packages even if their poseidonVersion is not
      --ignorePoseidonVersion
                                 compatible with the trident version. The assumption
410
                                 is, that the package is already structurally adjusted
411
                                to the trident version and only the version number is
412
                                lagging behind.
413
                                Part of the package version number in the
      --versionComponent ARG
414
                                POSEIDON.yml file that should be updated: Major,
415
                                Minor or Patch (see https://semver.org)
416
                                 (default: Patch)
417
                                Should update of checksums in the POSEIDON.yml file
      --noChecksumUpdate
418
                                be skipped
419
      --ignoreGeno
                                 ignore SNP and GenoFile
420
      --newContributors ARG
                                Contributors to add to the POSEIDON.yml file in the
421
                                form "[Firstname Lastname] (Email address);..."
422
      --logText ARG
                                Log text for this version jump in the CHANGELOG file
423
                                 (default: "not specified")
424
                                Normally the POSEIDON.yml files are only changed if
      --force
425
                                 the poseidonVersion is adjusted or any of the
426
                                 checksums change. With --force a package version
427
                                 update can be triggered even if this is not the case.
   It can be called with a lot of optional arguments
429
   trident update -d ... -d ... \
      --poseidonVersion "X.X.X" \
431
      --versionComponent Major/Minor/Patch \
432
     --noChecksumUpdate
433
      --ignoreGeno
434
      --newContributors "[Firstname Lastname] (Email address);..."
435
```

```
--logText "short description of the update"
--force
```

By default update will not edit a package's POSEIDON.yml file, even when arguments like --versionComponent,
--newContributors or --logText are explicitly set. This default exists to run the function on a large set of
packages where only few of them were edited and need an active update. A package will only be modified by
update if either

- any of the files with checksums (e.g. the genotype data) in it were modified,
- the --poseidonVersion argument differs from the poseidonVersion in the package's POSEIDON.yml file
- or the --force flag was set in update.

442

443

445

448

449

450

451

452

453

454

455

456

457

459

460

461

If any of these applies to a package in the search directory (--baseDir / -d), it will be updated. This includes the following steps:

- If --poseidonVersion is different from the poseidonVersion field in the package, then that will be updated.
- The packageVersion will be incremented. If --versionComponent is not set, then it falls back to Patch, so a change in the last position of the three digit version number. Minor increments the middle, and Major the first position (see semantic versioning).
- The lastModified field will be updated to the current day (based on your computer's system time).
- The contributors in --newContributors will be added to the contributor field if they're not there already.
- If any checksums changed, then they will be updated. If certain checksums are not set yet, then they will be added. The checksum update can be skipped with --noChecksumUpdate or partially skipped for the genotype data with --ignoreGeno.
- The CHANGELOG.md file will be updated with a new row for the new version and the text in --logText (default: "not specified"), which will be appended as the first line of the file. If no CHANGELOG.md file exists, then it will be created and referenced in the POSEIDON.yml file.

262 :heavy_exclamation_mark: As update reads and rewrites POSEIDON.yml files, it may change their inner
263 order, layout or even content (e.g. if they have fields which are not in the Poseidon package definition). Create a
264 backup of the POSEIDON.yml file before running update if you are uncertain.

$_{ ilde{4}65}$ 4 Inspection commands

4.1 List command

list lists packages, groups and individuals of the datasets you use, or of the packages available on the server.

Click here for command line details

```
Usage: trident list ((-d|--baseDir DIR) | --remote [--remoteURL ARG])

(--packages | --groups | --individuals

[-j|--jannoColumn JANNO_HEADER]) [--raw]

List packages, groups or individuals from local or remote Poseidon

repositories
```

475 Available options:

```
-h,--help
                             Show this help text
476
                             a base directory to search for Poseidon Packages
     -d,--baseDir DIR
477
                             (could be a Poseidon repository)
478
                             list packages from a remote server instead the local
     --remote
479
                             file system
480
     --remoteURL ARG
                             URL of the remote Poseidon server
481
                             (default: "https://c107-224.cloud.gwdg.de")
482
     --packages
                             list all packages
483
     --groups
                             list all groups, ignoring any group names after the
484
                             first as specified in the Janno-file
485
                             list individuals
     --individuals
486
     -j,--jannoColumn JANNO_HEADER
487
                             list additional fields from the janno files, using
                             the Janno column heading name, such as Country, Site,
489
                             Date_C14_Uncal_BP, Endogenous, ...
490
     --raw
                             output table as tsv without header. Useful for piping
                             into grep or awk
492
     --ignoreGeno
                             ignore SNP and GenoFile
493
   To list packages from your local repositories, as seen above you can run
   trident list -d ... -d ... --packages
495
   This will yield a table like this
    497
                                            1
                     Title
                                                Date
                                                        | Nr Individuals |
   499
   500
   501
   | 2018_BostonDatashare_modern_published
                                           | 2020-08-10 | 2772
502
                                            1 ...
                                                        1
503
504
   so a nicely formatted table of all packages, their last update and the number of individuals in it.
505
   To view packages on the remote server, instead of using directories to specify the locations of repositories on
   your system, you can use --remote to show packages on the remote server. For example
   trident list --packages --remote
508
   will result in a view of all published packages in our public online repository.
   You can also list groups, as defined in the third column of EIGENSTRAT ..ind files (or the first column of a
510
   PLINK .fam file), and individuals:
511
   trident list -d ... -d ... --groups
512
   trident list -d ... -d ... --individuals
513
   The --individuals flag also provides a way to immediately access information from the .janno
   files on the command line. This works with the -j / -- jannoColumn option. For example adding
```

```
--jannoColum Country --jannoColumn Date_C14_Uncal_BP to the commands above will add the Country and the Date_C14_Uncal_BP columns to the respective output tables.
```

Note that if you want a less fancy table, for example because you want to load this into Excel, or pipe into another command that cannot deal with the neat table layout, you can use the --raw option to output that table as a simple tab-delimited stream.

521 4.2 Summarise command

summarise prints some general summary statistics for a given poseidon dataset taken from the .janno files.

523 Click here for command line details

```
Usage: trident summarise (-d|--baseDir DIR) [--raw]
524
     Get an overview over the content of one or multiple Poseidon packages
525
   Available options:
527
      -h,--help
                                Show this help text
528
     -d,--baseDir DIR
                                a base directory to search for Poseidon Packages
                                (could be a Poseidon repository)
530
      --raw
                                output table as tsv without header. Useful for piping
531
```

into grep or awk

You can run it with

```
534 trident summarise -d ... -d ...
```

which will show you context information like – among others – the number of individuals in the dataset, their sex distribution, the mean age of the samples (for ancient data) or the mean coverage on the 1240K SNP array in a table. summarise depends on complete .janno files and will silently ignore missing information for some statistics.

You can use the --raw option to output the summary table in a simple, tab-delimited layout.

4.3 Survey command

```
survey tries to indicate package completeness (mostly focused on .janno files) for poseidon datasets.
```

Click here for command line details

```
Usage: trident survey (-d|--baseDir DIR) [--raw]

Survey the degree of context information completeness for Poseidon packages

545
```

546 Available options:

```
^{547} -h,--help Show this help text
```

548 -d,--baseDir DIR a base directory to search for Poseidon Packages

(could be a Poseidon repository)

550 --raw output table as tsv without header. Useful for piping

into grep or awk

552 Running

549

551

trident survey -d ... -d ...

will yield a table with one row for each package. See trident survey -h for a legend which cell of this table means what.

Again you can use the --raw option to output the survey table in a tab-delimited format.

4.4 Validate command

validate checks poseidon datasets for structural correctness.

559 Click here for command line details

Usage: trident validate (-d|--baseDir DIR) [--verbose]

Check one or multiple Poseidon packages for structural correctness

563 Available options:

562

577

580

-h,--help Show this help text

565 -d,--baseDir DIR a base directory to search for Poseidon Packages

(could be a Poseidon repository)

567 --verbose print more output to the command line

568 --ignoreGeno ignore SNP and GenoFile

569 --noExitCode do not produce an explicit exit code

You can run it with

571 trident validate -d ... -d ...

and it will either report a success (Validation passed) or failure with specific error messages to simplify fixing the issues.

validate tries to ensure that each package in the dataset adheres to the schema definition. Here is a list of what is checked:

- Presence of the necessary files
 - Full structural correctness of .bib and .janno file
- Superficial correctness of genotype data files. A full check would be too computationally expensive
- Correspondence of BibTeX keys in .bib and .janno
 - Correspondence of individual and group IDs in .janno and genotype data files

In fact much of this validation already runs as part of the general package reading pipeline invoked for many trident subcommands (e.g. forge). validate is meant to be more thorough, though, and will explicitly fail if even a single package is broken.
