2	0.1 Guide for trident v1.	2.0.0 to v1.2.1.0					
3							
4	0.1.2 Package creation and manipulation commands						
5	0.1.3 Inspection commands						
6	0.1 Guide for triden	t v1.2.0.0 to v1.2.1.0					
7	0.1.1 The trident CLI						
8	Trident is a command line so	ftware tool structured in multiple subcommands. If you installed it properly you					
9	can call it on the command line by typing trident. This will show an overview of the general options and all						
10	subcommands, which are exp	lained in detail below.					
11	Usage: trident [version	n] [logMode ARG] [errLength ARG]					
12	[inPlin]	kPopName ARG] (COMMAND COMMAND)					
13	trident is a managemen	t and analysis tool for Poseidon packages. Report issues					
14	here: https://github.co	om/poseidon-framework/poseidon-hs/issues					
15							
16	Available options:						
17	-h,help	Show this help text					
18	version	Show version number					
19	logMode ARG	How information should be reported: NoLog, SimpleLog,					
20		DefaultLog, ServerLog or VerboseLog					
21		(default: DefaultLog)					
22	errLength ARG	After how many characters should a potential error					
23		message be truncated. "Inf" for no truncation.					
24		(default: CharCount 1500)					
25	inPlinkPopName ARG	Where to read the population/group name from the FAM					
26		file in Plink-format. Three options are possible:					
27		asFamily (default) asPhenotype asBoth.					
28	Package creation and man:	inulation commands:					
30	init	Create a new Poseidon package from genotype data					
31	fetch	Download data from a remote Poseidon repository					
32	forge	Select packages, groups or individuals and create a					
33	6	new Poseidon package from them					
34	genoconvert	Convert the genotype data in a Poseidon package to a					
35	0	different file format					
36	update	Update POSEIDON.yml files automatically					
37	•						
38	Inspection commands:						
39	list	List packages, groups or individuals from local or					
40		remote Poseidon repositories					
41	summarise	Get an overview over the content of one or multiple					
42		Poseidon packages					

```
summarize
                                  Synonym for summarise
43
                                  Survey the degree of context information completeness
     survey
44
                                  for Poseidon packages
45
                                  Check one or multiple Poseidon packages for
      validate
46
                                   structural correctness
47
   Trident allows to work directly with genotype data (see -p below), but its optimized for the interaction with
   Poseidon packages, which wrap and contextualize the data. Most trident subcommands therefore have a central
49
   parameter, called --baseDir or simply -d to specify one or more base directories to look for packages. For example,
50
   if all Poseidon packages live inside a repository at /path/to/poseidon/packages you would simply say trident
   <subcommand> -d /path/to/poseidon/dirs/ and trident would automatically search all subdirectories inside
52
   of the repository for valid Poseidon packages (as identified by valid POSEIDON.yml files).
53
   You can arrange a poseidon repository in a hierarchical way. For example:
   /path/to/poseidon/packages
55
        /modern
56
            /2019_poseidon_package1
            /2019_poseidon_package2
58
        /ancient
59
            /...
            /...
61
        /Reference_Genomes
62
            /...
            /...
64
   You can use this structure to select only the level of packages you're interested in, even individual ones, and you
   can make use of the fact that -d can be given multiple times.
66
   Being able to specify one or multiple repositories is often not enough, as you may have your own data to
67
   co-analyse with the main repository. This is easy to do, as you simply need to provide your own genotype data as
   yet another Poseidon package to be added to your trident command. For example, let's say you have genotype
69
   data in EIGENSTRAT format (trident supports EIGENSTRAT and PLINK as formats.):
70
   ~/my_project/my_project.geno
   ~/my_project/my_project.snp
72
   ~/my_project/my_project.ind
   then you can make that to a skeleton Poseidon package with the init command. You can also do it manually by
   simply adding a POSEIDON.yml file, with for example the following content:
75
   poseidonVersion: 2.5.0
   title: My_awesome_project
77
   description: Unpublished genetic data from my awesome project
78
   contributor:
      - name: Stephan Schiffels
80
        email: schiffels@institute.org
81
   packageVersion: 0.1.0
   lastModified: 2020-10-07
```

genotypeData:

```
format: EIGENSTRAT

genoFile: my_project.geno

snpFile: my_project.snp

indFile: my_project.ind

jannoFile: my_project.janno

bibFile: sources.bib
```

Two remarks: 1) all file paths are considered *relative* to the directory in which POSEIDON.yml resides. Here we assume that you put this file into the same directory as the three genotype files. 2) Besides the genotype data files there are two (technically optional) files referenced by this example POSEIDON.yml file: sources.bib and my_project.janno. Of course you can add them manually - init automatically creates empty dummy versions.

Once you have set up your own "Poseidon" package (which is really only a skeleton so far), you can add it to your trident analysis, by simply adding your project directory to the command using -d, for example:

```
197 trident list -d /path/to/poseidon/packages/modern \
198  -d /path/to/poseidon/packages/ReferenceGenomes
199  -d ~/my_project --packages
```

118

0.1.1.1.1 Logging and command line output For all subcommands the general argument --logMode defines how trident reports messages (to stderr) on the command line:

- NoLog: Hides all messages.
- SimpleLog: Plain and simple output to stderr.
- DefaultLog: Adds severity indicators before each message. (default setting)
- ServerLog: Additionally adds timestamps before each message.
 - *VerboseLog*: Shows not just messages on the log levels Info, Warning and Error like the other modes, but also on the more verbose level Debug. Use this for debugging.

109 **0.1.1.1.2 Duplicates**

- If multiple packages in a package repository share the same title, then trident will try to select the one with the highest version number. If this is not sufficient to resolve the conflict, trident will stop. An exception for that is the list subcommand, which will read and report all packages/groups/individuals in all versions.
- Individual/sample names (Poseidon_IDs) within one package have to be unique, or trident will stop.
- We generally also discourage ID duplicates across packages in package repositories, but trident will generally continue with them after printing a warning. This does not apply for validate, by default (you can change this behaviour with --ignoreDuplicates), and forge offers a special mechanism to resolve duplicates within its selection language (see below).

o.1.1.1.3 Group names in .fam files The .fam file of Plink-formatted genotype data is used inconsistently across different popular aDNA software tools to store group/population name information. The (global) option --inPlinkPopName with the arguments asFamily (default), asPhenotype and asBoth allows to control the reading of the population name from Plink .fam files. The subcommands that write genotype data (forge, genoconvert) have a corresponding option --outPlinkPopName to specify this for the output.

124 **0.1.1.1.4** Whitespaces in the .janno file While reading the .janno file trident trims all leading and trailing whitespaces around individual cells. Also all instances of the No-Break Space unicode character will be removed. This means these whitespaces will not be preserved when a package is forged.

127 0.1.2 Package creation and manipulation commands

0.1.2.1 Init command init creates a new, valid Poseidon package from genotype data files. It adds a valid
 POSEIDON.yml file, a dummy .janno file for context information and an empty .bib file for literature references.

Click here for command line details

```
Usage: trident init ((-p|--genoOne ARG) | --inFormat ARG --genoFile ARG
131
                           --snpFile ARG --indFile ARG) [--snpSet ARG]
132
                         (-o|--outPackagePath ARG) [-n|--outPackageName ARG]
133
                         [--minimal]
     Create a new Poseidon package from genotype data
135
136
   Available options:
137
                                Show this help text
      -h,--help
138
      -p,--genoOne ARG
                                one of the input genotype data files. Expects .bed or
139
                                 .bim or .fam for PLINK and .geno or .snp or .ind for
140
                                EIGENSTRAT. The other files must be in the same
141
                                directory and must have the same base name
142
                                the format of the input genotype data: EIGENSTRAT or
      --inFormat ARG
143
                                PLINK (only necessary for data input with --genoFile
144
                                + --snpFile + --indFile)
145
      --genoFile ARG
                                the input geno file path
146
      --snpFile ARG
                                the input snp file path
147
      --indFile ARG
                                the input ind file path
148
                                the snpSet of the package: 1240K, HumanOrigins or
      --snpSet ARG
                                Other. (only relevant for data input with
150
                                -p|--genoOne or --genoFile + --snpFile + --indFile,
151
                                because the packages in a -d|--baseDir already have
152
                                this information in their respective POSEIDON.yml
                                files) Default: Other
154
                                the output package directory path
      -o,--outPackagePath ARG
155
      -n,--outPackageName ARG
                                the output package name - this is optional: If no
156
                                name is provided, then the package name defaults to
157
                                the basename of the (mandatory) --outPackagePath
158
                                argument
      --minimal
                                should only a minimal output package be created?
160
   The command
161
   trident init \
162
      --inFormat EIGENSTRAT/PLINK \
163
      --genoFile path/to/geno_file \
164
      --snpFile path/to/snp_file \
165
```

```
--indFile path/to/ind_file \
166
      --snpSet 1240K|HumanOrigins|Other \
167
     -o path/to/new_package_name
168
```

requires the format (--inFormat) of your input data (either EIGENSTRAT or PLINK), the paths to the respective 169 files (--genoFile, --snpFile, --indFile), and optionally the "shape" of these files (--snpSet), so if they cover 170 the 1240K, the HumanOrigins or an Other SNP set. A simpler interface added in trident 0.29.0 is available with -p (+ --snpSet). 172

	EIGENSTRAT	PLINK
genoFile	.geno	.bed
${\rm snpFile}$.snp	$. \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\$
$\operatorname{indFile}$.ind	.fam

The output package of init is created as a new directory -o, which should not already exist, and gets the package title corresponding to the basename of -o. You can also set the title explicitly with -n. The --minimal 174 flag causes init to create a minimal package with a very basic POSEIDON.yml and no .bib and .janno files. 175

0.1.2.2 Fetch command fetch allows to download Poseidon packages from a remote Poseidon server. Read more about this repository here. 177

Click here for command line details

```
Usage: trident fetch (-d|--baseDir DIR)
179
                           (--downloadAll |
180
                             (--fetchFile ARG | (-f|--fetchString ARG)))
181
                           [--remoteURL ARG]
182
```

Download data from a remote Poseidon repository

```
Available options:
```

178

183

```
186
      -h,--help
                                Show this help text
187
      -d,--baseDir DIR
                                a base directory to search for Poseidon Packages
188
                                (could be a Poseidon repository)
189
      --downloadAll
                                download all packages the server is offering
190
      --fetchFile ARG
                                A file with a list of packages. Works just as -f, but
191
                                multiple values can also be separated by newline, not
192
                                just by comma. -f and --fetchFile can be combined.
193
     -f,--fetchString ARG
                                List of packages to be downloaded from the remote
194
                                server. Package names should be wrapped in asterisks:
195
                                *package_title*. You can combine multiple values with
196
                                comma, so for example: "*package_1*, *package_2*,
197
                                *package_3*". fetchString uses the same parser as
198
                                forgeString, but does not allow excludes. If groups
199
                                or individuals are specified, then packages which
                                include these groups or individuals are included in
201
                                the download.
202
```

```
--remoteURL ARG
                                  URL of the remote Poseidon server
203
                                   (default: "https://server.poseidon-adna.org")
204
   It works with
    trident fetch -d ... -d ... \
206
      -f "*package_title_1*,*package_title_2*,*package_title_3*,group_name,<individual1>"
207
    and the entities you want to download must be listed either in a simple string of comma-separated values, which
208
    can be passed via -f/--fetchString, or in a text file (--fetchFile). Entities are then combined from these
209
    sources.
    Entities are specified using a special syntax (see also the documentation of forge below): Package titles are
211
    wrapped in asterisks: *package_title*, group names are spelled as is, and individual names are wrapped in
212
    angular brackets, so <individual1>. Fetch will figure out which packages need to be downloaded to include all
213
   specified entities. --downloadAll, which can be given instead of -f and --fetchFile, causes fetch to download
214
    all packages from the server. The downloaded packages are added in the first (!) -d directory (which gets created
215
   if it doesn't exist), but downloads are only performed if the respective packages are not already present in the
216
   latest version in any of the -d dirs.
217
   Note that trident fetch makes most sense in combination with trident list --remote: First one can inspect
218
    what is available on the server, then one can create a custom fetch command.
    fetch also has the optional arguments --remote https:://..." to name an alternative poseidon server. The
220
    default points to the DAG server.
221
    0.1.2.3 Forge command forge creates new Poseidon packages by extracting and merging packages,
    populations and individuals from your Poseidon repositories.
223
    Click here for command line details
224
    Usage: trident forge ((-d|--baseDir DIR) |
225
                              ((-p|--genoOne ARG) | --inFormat ARG --genoFile ARG
226
                                --snpFile ARG --indFile ARG) [--snpSet ARG])
227
                            [--forgeFile ARG | (-f|--forgeString ARG)]
228
                            [--selectSnps ARG] [--intersect] [--outFormat ARG]
229
                            [--minimal] [--onlyGeno] (-o|--outPackagePath ARG)
230
                            [-n|--outPackageName ARG] [--packagewise]
231
                            [--outPlinkPopName ARG]
232
      Select packages, groups or individuals and create a new Poseidon package from
233
      them
234
235
    Available options:
236
      -h,--help
                                  Show this help text
237
      -d,--baseDir DIR
                                  a base directory to search for Poseidon Packages
238
                                   (could be a Poseidon repository)
239
                                  one of the input genotype data files. Expects .bed or
      -p,--genoOne ARG
240
                                   .bim or .fam for PLINK and .geno or .snp or .ind for
241
                                  EIGENSTRAT. The other files must be in the same
242
                                  directory and must have the same base name
243
```

the format of the input genotype data: EIGENSTRAT or --inFormat ARG PLINK (only necessary for data input with --genoFile 245 + --snpFile + --indFile) 246 --genoFile ARG the input geno file path 247 --snpFile ARG the input snp file path 248 --indFile ARG the input ind file path 249 --snpSet ARG the snpSet of the package: 1240K, HumanOrigins or 250 Other. (only relevant for data input with 251 -p|--genoOne or --genoFile + --snpFile + --indFile, 252 because the packages in a -d|--baseDir already have 253 this information in their respective POSEIDON.yml 254 files) Default: Other 255 --forgeFile ARG A file with a list of packages, groups or individual samples. Works just as -f, but multiple values can 257 also be separated by newline, not just by comma. 258 Empty lines are ignored and comments start with "#", so everything after "#" is ignored in one line. 260 Multiple instances of -f and --forgeFile can be 261 given. They will be evaluated according to their input order on the command line. 263 -f,--forgeString ARG List of packages, groups or individual samples to be 264 combined in the output package. Packages follow the syntax *package_title*, populations/groups are simply 266 group_id and individuals <individual_id>. You can 267 combine multiple values with comma, so for example: "*package_1*, <individual_1>, <individual_2>, 269 group_1". Duplicates are treated as one entry. 270 Negative selection is possible by prepending "-" to 271 the entity you want to exclude (e.g. "*package_1*, 272 -<individual_1>, -group_1"). forge will apply 273 excludes and includes in order. If the first entity 274 is negative, then forge will assume you want to merge 275 all individuals in the packages found in the baseDirs 276 (except the ones explicitly excluded) before the 277 exclude entities are applied. An empty forgeString 278 (and no --forgeFile) will therefore merge all 279 available individuals. If there are individuals in 280 your input packages with equal individual id, but 281 different main group or source package, they can be 282 specified with the special syntax 283 "<package:group:individual>". 284 --selectSnps ARG To extract specific SNPs during this forge operation, 285 provide a Snp file. Can be either Eigenstrat (file 286 ending must be '.snp') or Plink (file ending must be '.bim'). When this option is set, the output package 288

```
will have exactly the SNPs listed in this file. Any
289
                                SNP not listed in the file will be excluded. If
290
                                option '--intersect' is also set, only the SNPs
291
                                overlapping between the SNP file and the forged
292
                                packages are output.
293
      --intersect
                                Whether to output the intersection of the genotype
294
                                files to be forged. The default (if this option is
295
                                not set) is to output the union of all SNPs, with
296
                                genotypes defined as missing in those packages which
297
                                do not have a SNP that is present in another package.
298
                                With this option set, the forged dataset will
299
                                typically have fewer SNPs, but less missingness.
300
      --outFormat ARG
                                the format of the output genotype data: EIGENSTRAT or
301
                                PLINK. Default: PLINK
302
      --minimal
                                should only a minimal output package be created?
303
      --onlyGeno
                                should only the resulting genotype data be returned?
                                This means the output will not be a Poseidon package
305
      -o, -- outPackagePath ARG
                                the output package directory path
306
     -n,--outPackageName ARG
                                the output package name - this is optional: If no
307
                                name is provided, then the package name defaults to
308
                                the basename of the (mandatory) --outPackagePath
309
                                argument
310
      --packagewise
                                Skip the within-package selection step in forge. This
311
                                will result in outputting all individuals in the
312
                                relevant packages, and hence a superset of the
                                requested individuals/groups. It may result in better
314
                                performance in cases where one wants to forge entire
315
                                packages or almost entire packages. Details: Forge
316
                                conceptually performs two types of selection: First,
317
                                it identifies which packages in the supplied base
318
                                directories are relevant to the requested forge, i.e.
319
                                whether they are either explicitly listed using
320
                                *PackageName*, or because they contain selected
321
                                individuals or groups. Second, within each relevant
322
                                package, individuals which are not requested are
323
                                removed. This option skips only the second step, but
324
                                still performs the first.
325
                                Where to write the population/group name into the FAM
      --outPlinkPopName ARG
326
                                file in Plink-format. Three options are possible:
327
                                asFamily (default) | asPhenotype | asBoth. See also
328
                                --inPlinkPopName.
329
   forge can be used with
330
   trident forge -d ... -d ... \
      -f "*package_name*, group_id, <individual_id>" \
332
     -o path/to/new_package_name
333
```

```
where the entities (packages, groups/populations, individuals/samples) you want in the output package can be
denoted either as a string on the command line (-f/--forgeString), or in an input text file (--forgeFile).

See the section below for the syntax of this selection language. Do not forget to wrap the --forgeString query
in quotes.
```

Including one or multiple Poseidon packages with -d is not the only way to include data for a forge operation.

It is also possible to consider unpackaged genotype data directly with -p (+ --snpSet) or --inFormat +

--genoFile + --snpFile + --indFile (+ --snpSet). This makes the following example possible, where we

merge data from one Poseidon package and two genotype datasets to get a new EIGENSTRAT dataset.

```
trident forge \
342
      -d 2017_GonzalesFortesCurrentBiology \
343
      -p 2018_VeeramahPNAS/2018_VeeramahPNAS.fam \
344
      --inFormat PLINK \
      --genoFile 2017_HaberAJHG/2017_HaberAJHG.bed \
346
      --snpFile 2017 HaberAJHG/2017 HaberAJHG.bim \
347
      --indFile 2017_HaberAJHG/2017_HaberAJHG.fam \
      -f "<STR241.SG>,<ERS1790729.SG>,Iberia_HG.SG" \
349
      -o testpackage \
350
      --outFormat EIGENSTRAT \
      --onlyGeno
352
```

375

ol.1.2.3.1 The forge selection language The text in --forgeString and --forgeFile are parsed as a domain specific query language that describes precisely which entities should be compiled in the output package of a given forge operation. The language has multiple syntactic elements and a specific evaluation logic.

In general a --forgeString query consists of multiple entities, separated by ,. The main entities are Poseidon packages, groups/populations and individuals/samples:

- Each package title is surrounded by *: *package*. That means if you want all individuals of the Poseidon
 package 2019_Jeong_InnerEurasia in the output package you would add *2019_Jeong_InnerEurasia*
 to the query.
- Groups/populations are not specially marked: group. So to get all individuals of the group Swiss_Roman_period, you would simply add Swiss_Roman_period.
- Individuals/samples are surrounded by < and >: <individual>. ALAO26 therefore becomes <ALAO26>. A second way to denote individuals is with the more verbose and specific syntax <package:group:individual>. Such defined individuals take precedence over differently defined ones (so: directly with <individual> or as a subset of *package* or group). This allows to resolve duplication issues precisely at least in cases where the duplicated individuals differ in source package or primary group.

In the --forgeFile each line is treated as a separate forgeString, empty lines are ignored and #s start comments.

So this is a valid forgeFile:

```
# Packages
# Package1*, *package2*

# Groups and individuals from other packages beyond package1 and package2
# group1, <individual1>, group2, <individual2>, <individual3>
```

- 376 # group2 has two outlier individuals that should be ignored
- 377 -<bad_individual1> # This one has very low coverage
- 378 -<bad_individual2> # This one is from a different time period
- By prepending to the bad individuals, we can exclude them from the forged package. forge fig-
- ures out the final list of samples to include by executing all forge-entities in order. So an entity list
- *PackageA*,-<Individual1>,GroupA may result in a different outcome than *PackageA*,GroupA,-<Individual1>,
- depending on whether <Individual1> belongs to GroupA or not. If the forge entity list starts with a negative
- entity, or if the entity list is empty, forge will implicitly assume you want to include all individuals in all
- packages found in the baseDirs (except the ones explicitly excluded, of course).
- An empty forgeString will therefore merge all available individuals.
- O.1.2.3.2 Treatment of the .janno file while merging forge merges and subsets .janno files along with the genotype data. If a package lacks a .janno file, then a basic one will be created internally based on the information in the genotype data, and used for the output. Missing columns across packages will be filled with n/a.
- For merging two .janno files ${\bf A}$ and ${\bf B}$ the following rules apply regarding undefined, arbitrary additional columns:
 - If **A** has an additional column which is not in **B** then empty cells in the rows imported from **B** are filled with n/a.
 - If **A** and **B** share additional columns with identical column name, then they are treated as semantically identical units and merged accordingly.
 - In the resulting .janno file, all additional columns from both **A** and **B** are sorted alphabetically and appended after the normal, specified variables.
- 397 The following example illustrates the described behaviour:

398 **A.janno**

391

393

394

395

Poseidon_ID	Group_Name	Genetic_Sex	AdditionalColumn1	AdditionalColumn2
XXX011	POP1	M	A	D
XXX012	POP2	F	В	E
XXX013	POP1	M	\mathbf{C}	F

B.janno

Poseidon_ID	Group_Name	${\rm Genetic_Sex}$	AdditionalColumn3	AdditionalColumn2
YYY022	POP5	F	G	J
YYY023	POP5	F	Н	K
YYY024	POP5	M	I	L

$_{\circ}$ A.janno + B.janno

Poseidon_ID	Group_Name	e Genetic_Sex	${\bf Additional Column 1}$	${\bf Additional Column 2}$	${\bf Additional Column 3}$
XXX011	POP1	M	A	D	n/a

Poseidon_ID	Group_Name	Genetic_Sex	AdditionalColumn1	AdditionalColumn2	AdditionalColumn3
XXX012	POP2	F	В	E	n/a
XXX013	POP1	M	\mathbf{C}	F	n/a
YYY022	POP5	F	n/a	J	G
YYY023	POP5	F	n/a	K	H
YYY024	POP5	M	n/a	L	I

o.1.2.3.3 Treatment of the .ssf file while merging The Sequencing Source File (short .ssf file) is forged in exactly the same way as the janno file. SSF files that are present are included in the forge product in the way that the user expects, following selection of those entities which are listed in the poseidon_IDs columns of the SSF files. Columns that are only present in some packages, including those not defined by our [Schema] are also included in the forged product in the same way as described for Janno above.

0.1.2.3.4 Other options Just as for init the output package of forge is created as a new directory -o.

The title can also be explicitly defined with -n.

--minimal allows for the creation of a minimal output package without .bib and .janno. This is especially useful for data analysis pipelines, where only the genotype data is required. Even more basic output comes with --onlyGeno, which means that only the genotype data is returned without any Poseidon package.

forge has a an optional flag --intersect, that defines, if the genotype data from different packages should be merged with an **union** or an **intersect** operation. The default (if this option is not set) is to output the union of all SNPs, with genotypes defined as missing in samples from packages which do not have a SNP that is present in another package. With this option set, on the other hand, the forged dataset will typically have fewer SNPs, but less missingness.

--intersect also influences the automatic determination of the snpSet field in the POSEIDON.yml file for the resulting package. If the snpSets of all input packages are identical, then the resulting package will just inherit this configuration. Otherwise forge applies the following pairwise merging logic:

Input snpSet A	Input snpSet B	intersect	Ouput snpSet
Other	*	*	Other
1240K	HumanOrigins	True	HumanOrigins
1240K	HumanOrigins	False	$1240 \mathrm{K}$

--selectSnps allows to provide forge with a SNP file in EIGENSTRAT (.snp) or PLINK (.bim) format to create a package with a specific selection. When this option is set, the output package will have exactly the SNPs listed in this file. Any SNP not listed in the file will be excluded. If --intersect is also set, only the SNPs overlapping between the SNP file and the forged packages are output.

Merging genotype data across different data sources and file formats is tricky. forge is more verbose about potential issues, if the --logMode flag is set to VerboseLog.

The --onlyGeno command specifies that only genotype data should be output, not an entire Poseidon package.

With --packagewise the within-package selection step in forge can be skipped. This will result in outputting
all individuals in the relevant packages, and hence a superset of the requested individuals/groups. It may result
in better performance in cases where one wants to forge entire packages.

```
different file format. The respective entries in the POSEIDON.yml file are changed accordingly.

      --snpSet ARG
                                the snpSet of the package: 1240K, HumanOrigins or
454
                                Other. (only relevant for data input with
455
                                -p|--genoOne or --genoFile + --snpFile + --indFile,
456
                                because the packages in a -d|--baseDir already have
457
                                this information in their respective POSEIDON.yml
458
                                files) Default: Other
459
      --outFormat ARG
                                the format of the output genotype data: EIGENSTRAT or
460
                                PLINK.
461
      --onlyGeno
                                should only the resulting genotype data be returned?
462
                                This means the output will not be a Poseidon package
463
                                the output package directory path - this is optional:
      -o, -- outPackagePath ARG
464
                                If no path is provided, then the output is written to
465
                                the directories where the input genotype data file
466
                                 (.bed/.geno) is stored
      --removeOld
                                Remove the old genotype files when creating the new
468
469
      --outPlinkPopName ARG
                                Where to write the population/group name into the FAM
470
                                file in Plink-format. Three options are possible:
                                asFamily (default) | asPhenotype | asBoth. See also
472
                                --inPlinkPopName.
473
```

0.1.2.4 Genoconvert command genoconvert converts the genotype data in a Poseidon package to a

```
With the default setting
    trident genoconvert -d ... -d ... --outFormat EIGENSTRAT | PLINK
475
   all packages in -d will be converted to the desired --outFormat (either EIGENSTRAT or PLINK), if the data is
    not already in this format. This includes updating the respective POSEIDON.yml files.
477
   The "old" data is not deleted, but kept around. That means conversion can result in a package with both PLINK
478
    and EIGENSTRAT data, but only one is linked in the POSEIDON.yml file, and that is what will be used by
479
    trident. To delete the old data in the conversion you can add the --removeOld flag.
480
    Instead of -d to change Poseidon packages, the -p (+ --snpSet) or --inFormat + --genoFile + --snpFile
    + --indFile (+ --snpSet) allow to directly convert genotype data that is not wrapped in a Poseidon package
482
    and store it to a directory given in -o. See this example:
483
    trident genoconvert \
      -p 2018_Mittnik_Baltic/Mittnik_Baltic.bed \
485
      --outFormat EIGENSTRAT
486
      -o my_directory
    0.1.2.5 Update command update automatically harmonizes POSEIDON.yml files of one or multiple
488
    packages if the packages were changed. This is not an automatic update from one Poseidon version to the next!
489
    Click here for command line details
490
    Usage: trident update (-d|--baseDir DIR) [--poseidonVersion ARG]
491
                            [--ignorePoseidonVersion] [--versionComponent ARG]
492
                            [--noChecksumUpdate] [--newContributors ARG]
493
                            [--logText ARG] [--force]
494
      Update POSEIDON.yml files automatically
495
496
    Available options:
497

518
                                Normally the POSEIDON.yml files are only changed if
      --force
519
                                the poseidonVersion is adjusted or any of the
520
                                checksums change. With --force a package version
521
                                update can be triggered even if this is not the case.
522
```

523 It can be called with a lot of optional arguments

```
trident update -d ... -d ... \
--poseidonVersion "X.X.X" \
--versionComponent Major/Minor/Patch \
--noChecksumUpdate
--ignoreGeno
--newContributors "[Firstname Lastname](Email address);..."
--logText "short description of the update"
--force
```

By default update will not edit a package's POSEIDON.yml file, even when arguments like --versionComponent,
--newContributors or --logText are explicitly set. This default exists to run the function on a large set of
packages where only few of them were edited and need an active update. A package will only be modified by
update if either

- any of the files with checksums (e.g. the genotype data) in it were modified,
- the --poseidonVersion argument differs from the poseidonVersion in the package's POSEIDON.yml file
- or the --force flag was set in update.

536

537

539

542

543

545

546

548

549

551

552

553

554

If any of these applies to a package in the search directory (--baseDir/-d), it will be updated. This includes the following steps:

- If --poseidonVersion is different from the poseidonVersion field in the package, then that will be updated.
- The packageVersion will be incremented. If --versionComponent is not set, then it falls back to Patch, so a change in the last position of the three digit version number. Minor increments the middle, and Major the first position (see semantic versioning).
- The lastModified field will be updated to the current day (based on your computer's system time).
- The contributors in --newContributors will be added to the contributor field if they're not there already.
- If any checksums changed, then they will be updated. If certain checksums are not set yet, then they will be added. The checksum update can be skipped with --noChecksumUpdate or partially skipped for the genotype data with --ignoreGeno.
- The CHANGELOG.md file will be updated with a new row for the new version and the text in --logText (default: "not specified"), which will be appended as the first line of the file. If no CHANGELOG.md file exists, then it will be created and referenced in the POSEIDON.yml file.

:heavy_exclamation_mark: As update reads and rewrites POSEIDON.yml files, it may change their inner order,
 layout or even content (e.g. if they have fields which are not in the Poseidon package definition). Create a backup
 of the POSEIDON.yml file before running update if you are uncertain.

0.1.3 Inspection commands

559

```
packages available on the server.
560
    Click here for command line details
561
    Usage: trident list ((-d|--baseDir DIR) | --remote [--remoteURL ARG])
                          (--packages | --groups | --individuals
563
                             [-j|--jannoColumn JANNO HEADER]) [--raw]
564
      List packages, groups or individuals from local or remote Poseidon
566
      repositories
567
    Available options:
569
      -h,--help
                                  Show this help text
570
      -d,--baseDir DIR
                                  a base directory to search for Poseidon Packages
571
                                  (could be a Poseidon repository)
572
      --remote
                                  list packages from a remote server instead the local
573
                                  file system
      --remoteURL ARG
                                  URL of the remote Poseidon server
575
                                  (default: "https://server.poseidon-adna.org")
576
      --packages
                                  list all packages
577
                                  list all groups, ignoring any group names after the
      --groups
578
                                  first as specified in the Janno-file
579
                                  list individuals
      --individuals
580
      -j,--jannoColumn JANNO_HEADER
581
                                  list additional fields from the janno files, using
582
                                  the Janno column heading name, such as Country, Site,
583
                                  Date_C14_Uncal_BP, Endogenous, ...
584
                                  output table as tsv without header. Useful for piping
      --raw
585
                                  into grep or awk
586
    To list packages from your local repositories, as seen above you can run
587
    trident list -d ... -d ... --packages
588
    This will yield a nicely formatted table of all packages, their last update and the number of individuals in it.
589
    To view packages on the remote server, instead of using directories to specify the locations of repositories on
590
   your system, you can use --remote to show packages on the remote server. For example
591
    trident list --packages --remote
592
    will result in a view of all published packages in our public online repository.
593
    You can also list groups, as defined in the third column of EIGENSTRAT .ind files (or the first/last column of
594
    a PLINK .fam file), and individuals with --groups and --individuals instead of --packages.
595
   The --individuals flag provides a way to immediately access information from the .janno files on the command
    line. This works with the -j/--jannoColumn option. For example adding -j Country -j Date_C14_Uncal_BP
```

0.1.3.1 List command list lists packages, groups and individuals of the datasets you use, or of the

```
to the commands above will add the Country and the Date_C14_Uncal_BP columns to the respective output
    tables.
599
   Note that if you want a less fancy table, for example because you want to load this into Excel, or pipe into
    another command that cannot deal with the neat table layout, you can use the --raw option to output that
601
    table as a simple tab-delimited stream.
602
                                      summarise prints some general summary statistics for a given poseidon
    0.1.3.2
             Summarise command
603
    dataset taken from the .janno files.
604
    Click here for command line details
605
    Usage: trident summarise (-d|--baseDir DIR) [--raw]
      Get an overview over the content of one or multiple Poseidon packages
607
    Available options:
609
      -h,--help
                                  Show this help text
610
      -d,--baseDir DIR
                                  a base directory to search for Poseidon Packages
611
                                   (could be a Poseidon repository)
612
                                  output table as tsv without header. Useful for piping
      --raw
613
                                  into grep or awk
614
    You can run it with
615
    trident summarise -d ... -d ...
616
   which will show you context information like - among others - the number of individuals in the dataset, their
617
    sex distribution, the mean age of the samples (for ancient data) or the mean coverage on the 1240K SNP array
618
   in a table. summarise depends on complete .janno files and will silently ignore missing information for some
619
   statistics.
620
    You can use the --raw option to output the summary table in a simple, tab-delimited layout.
621
             Survey command survey tries to indicate package completeness (mostly focused on .janno files)
    for poseidon datasets.
623
    Click here for command line details
624
    Usage: trident survey (-d|--baseDir DIR) [--raw]
      Survey the degree of context information completeness for Poseidon packages
626
627
    Available options:
628
      -h,--help
                                  Show this help text
629
      -d,--baseDir DIR
                                  a base directory to search for Poseidon Packages
630
                                   (could be a Poseidon repository)
631
                                  output table as tsv without header. Useful for piping
      --raw
632
                                  into grep or awk
633
    Running
634
```

trident survey -d ... -d ...

- will yield a table with one row for each package. See trident survey -h for a legend which cell of this table means what.
- Again you can use the --raw option to output the survey table in a tab-delimited format.
- 639 0.1.3.4 Validate command validate checks poseidon datasets for structural correctness.
- 640 Click here for command line details
- 041 Usage: trident validate (-d|--baseDir DIR)
- 642 Check one or multiple Poseidon packages for structural correctness
- 644 Available options:

643

650

661

662

664

- 645 -h,--help Show this help text
- -d,--baseDir DIR a base directory to search for Poseidon Packages
- (could be a Poseidon repository)
- 648 --ignoreGeno ignore SNP and GenoFile
- 649 --fullGeno test parsing of all SNPs (by default only the first
 - 100 SNPs are probed)
- 651 --noExitCode do not produce an explicit exit code
- 652 --ignoreDuplicates do not stop on duplicated individual names in the
 - package collection
- You can run it with
- 655 trident validate -d ... -d ...
- and it will either report a success (Validation passed) or failure with specific error messages to simplify fixing
 the issues.
- validate tries to ensure that each package in the dataset adheres to the schema definition. Here is a list of what is checked:
- Presence of the necessary files
 - Full structural correctness of .bib and .janno file
- Superficial correctness of genotype data files by parsing the first 100 SNPs. A full check that parses all SNPs can be run with the --fullGeno option
 - Correspondence of BibTeX keys in .bib and .janno
- Correspondence of individual and group IDs in .janno and genotype data files
- In fact much of this validation already runs as part of the general package reading pipeline invoked for many trident subcommands (e.g. forge). validate is meant to be more thorough, though, and will explicitly fail if
- even a single package is broken.
- Remember to run it with --logMode VerboseLog to get more information if the output is not sufficient to debug
- an issue.
