                               remote Poseidon repositories
53
     summarise
                               Get an overview over the content of one or multiple
54
                               Poseidon packages
55
     survey
                               Survey the degree of context information completeness
56
                               for Poseidon packages
57
     validate
                               Check Poseidon packages or package components for
                                structural correctness
59
```

Trident allows to work directly with genotype data (see -p below), but its optimized for the interaction with

Poseidon packages, which wrap and contextualize the data. Most trident subcommands therefore have a central

parameter, called --baseDir or simply -d to specify one or more base directories to look for packages. For example,

if all Poseidon packages live inside a repository at /path/to/poseidon/packages you would simply say trident

 <subcommand> -d /path/to/poseidon/dirs/ and trident would automatically search all subdirectories inside
 of the repository for valid Poseidon packages (as identified by valid POSEIDON.yml files).

You can arrange a Poseidon repository in a hierarchical way. For example:

```
/path/to/poseidon/packages
67
        /modern
68
            /2019_poseidon_package1
            /2019_poseidon_package2
70
        /ancient
71
            /...
72
            /...
73
        /Reference Genomes
74
            /...
75
            /...
76
```

You can use this structure to select only the level of packages you're interested in, even individual ones, and you can make use of the fact that -d can be given multiple times.

Being able to specify one or multiple repositories is often not enough, as you may have your own data to co-analyse with the main repository. This is easy to do, as you simply need to provide your own genotype data as yet another Poseidon package to be added to your trident command. For example, let's say you have genotype data in EIGENSTRAT format (trident supports EIGENSTRAT and PLINK as formats.):

```
~/my_project/my_project.geno
//my_project/my_project.snp
//my_project/my_project.ind
```

```
simply adding a POSEIDON.yml file, with for example the following content:
87
    poseidonVersion: 2.7.1
    title: My_awesome_project
89
    description: Unpublished genetic data from my awesome project
90
    contributor:
      - name: Stephan Schiffels
92
        email: schiffels@institute.org
93
    packageVersion: 0.1.0
    lastModified: 2020-10-07
95
    genotypeData:
96
      format: EIGENSTRAT
97
      genoFile: my_project.geno
      snpFile: my_project.snp
99
      indFile: my_project.ind
100
    jannoFile: my_project.janno
101
    bibFile: sources.bib
102
    Two remarks: 1) all file paths are considered relative to the directory in which POSEIDON.yml resides. For this
    example we assume that this file is added into the same directory as the three genotype files. 2) Besides the
104
    genotype data files there are two (technically optional) files referenced by this example POSEIDON.yml file:
105
    sources.bib and my_project.janno. Of course you can add them manually - init automatically creates empty
106
    dummy versions.
107
    Once you have set up your own Poseidon package (which is really only a skeleton so far), you can add it to your
108
    trident analysis, by simply adding your project directory to the command using -d, for example:
109
    trident list -d /path/to/poseidon/packages/modern \
110
```

then you can make that to a skeleton Poseidon package with the init command. You can also do it manually by

121

123

124

125

114 1.1.1.1 Logging and command line output For all subcommands the general argument --logMode defines how trident reports messages (to stderr) on the command line:

• NoLog: Hides all messages.

-d ~/my_project --packages

• SimpleLog: Plain and simple output to stderr.

-d /path/to/poseidon/packages/ReferenceGenomes

- DefaultLog: Adds severity indicators before each message. (default setting)
 - ServerLog: Additionally adds timestamps before each message.
- VerboseLog: Shows not just messages on the log levels Info, Warning and Error like the other modes, but also on the more verbose level Debug. Use this for debugging.
- --debug is short for --logMode VerboseLog to activate this important log level more easily.

1.1.1.2 Package duplicates and versions

• For trident multiple packages in a set of base directories can share the same title, if they have different packageVersion numbers. If the version numbers are identical or missing, then trident stops with an

exception.

126

155

156

158

- The trident subcommands genoconvert, list, rectify, survey and validate by default consider all versions of each Poseidon package in the given base directories. The --onlyLatest flag causes them to instead only consider the latest versions.
- fetch and forge generally consider all package versions and their selection language (see below) allows for detailed version handling.
- summarize always only shows results for the latest package versions.

1.1.1.3 Individual/sample duplicates

- Individual/sample names (Poseidon_IDs) within one package have to be unique, or trident will stop.
- We also discourage sample duplicates across packages in package repositories, but trident will generally continue with them. validate will fail though, if the --ignoreDuplicates flag is not set.
- forge offers a special mechanism to resolve sample duplicates within its selection language.

1.1.1.4 Group names in .fam files The .fam file of Plink-formatted genotype data is used inconsistently
across different popular aDNA software tools to store group/population name information. The (global) option
--inPlinkPopName with the arguments asFamily (default), asPhenotype and asBoth allows to control the
reading of the population name from Plink .fam files. The subcommands that write genotype data (forge,
genoconvert) have a corresponding option --outPlinkPopName to specify this for the output.

1.1.1.5 Whitespaces in the .janno file While reading the .janno file trident trims all leading and trailing whitespaces around individual cells. Also all instances of the No-Break Space unicode character will be removed. This means these whitespaces will not be preserved when a package is forged.

1.2 Package creation and manipulation commands

1.2.1 Init command

init creates a new, valid Poseidon package from genotype data files. It adds a valid POSEIDON.yml file, a dummy .janno file for context information and an empty .bib file for literature references.

Click here for command line details

```
Usage: trident init ((-p|--genoOne FILE) | --inFormat FORMAT --genoFile FILE
--snpFile FILE --indFile FILE) [--snpSet SET]

(-o|--outPackagePath DIR) [-n|--outPackageName STRING]

[--minimal]
```

Create a new Poseidon package from genotype data

Available options:

```
-h,--help Show this help text

-p,--genoOne FILE One of the input genotype data files. Expects .bed,

.bim or .fam for PLINK and .geno, .snp or .ind for

EIGENSTRAT. The other files must be in the same

directory and must have the same base name.

The format of the input genotype data: EIGENSTRAT or
```

```
PLINK. Only necessary for data input with --genoFile
165
                                 + --snpFile + --indFile.
166
      --genoFile FILE
                                 Path to the input geno file.
167
      --snpFile FILE
                                 Path to the input snp file.
168
      --indFile FILE
                                 Path to the input ind file.
169
      --snpSet SET
                                 The snpSet of the package: 1240K, HumanOrigins or
170
                                 Other. Only relevant for data input with -p|--genoOne
171
                                 or --genoFile + --snpFile + --indFile, because the
172
                                 packages in a -d|--baseDir already have this
173
                                 information in their respective POSEIDON.yml files.
174
                                 (default: Other)
175
      -o,--outPackagePath DIR
                                 Path to the output package directory.
176
      -n, -- outPackageName STRING
177
                                 The output package name. This is optional: If no name
178
                                 is provided, then the package name defaults to the
179
                                 basename of the (mandatory) --outPackagePath
                                 argument. (default: Nothing)
181
      --minimal
                                 Should the output data be reduced to a necessary
182
                                 minimum and omit empty scaffolding?
   The command
184
   trident init \
      --inFormat EIGENSTRAT/PLINK \
186
      --genoFile path/to/geno_file \
187
      --snpFile path/to/snp_file \
      --indFile path/to/ind_file \
189
      --snpSet 1240K|HumanOrigins|Other \
190
      -o path/to/new_package_name
191
   requires the format (--inFormat) of your input data (either EIGENSTRAT or PLINK), the paths to the respective
192
   files (--genoFile, --snpFile, --indFile), and optionally the "shape" of these files (--snpSet), so if they cover
193
   the 1240K, the HumanOrigins or an Other SNP set. A simpler interface is available with -p (+ --snpSet).
```

	EIGENSTRAT	PLINK
genoFile	.geno	.bed
${\rm snpFile}$.snp	$. \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\$
indFile	.ind	.fam

The output package of init is created as a new directory -o, which should not already exist, and gets the package title corresponding to the basename of -o. You can also set the title explicitly with -n. The --minimal flag causes init to create a minimal package with a very basic POSEIDON.yml and no .bib and .janno files.

1.2.2 Fetch command

fetch allows to download Poseidon packages from a remote Poseidon server via a Web API. Read more about the data available with it here.

```
Click here for command line details
   Usage: trident fetch (-d|--baseDir DIR)
202
                           (--downloadAll |
                             (--fetchFile FILE | (-f|--fetchString DSL)))
204
                           [--remoteURL URL] [--archive STRING]
205
      Download data from a remote Poseidon repository
207
208
   Available options:
      -h,--help
                                 Show this help text
210
                                 A base directory to search for Poseidon packages.
      -d,--baseDir DIR
211
                                 Download all packages the server is offering.
      --downloadAll
212
      --fetchFile FILE
                                 A file with a list of packages. Works just as -f, but
213
                                 multiple values can also be separated by newline, not
214
                                 just by comma. -f and --fetchFile can be combined.
215
      -f,--fetchString DSL
                                 List of packages to be downloaded from the remote
216
                                 server. Package names should be wrapped in asterisks:
217
                                 *package title*. You can combine multiple values with
218
                                 comma, so for example: "*package_1*, *package_2*,
219
                                 *package_3*". fetchString uses the same parser as
220
                                 forgeString, but does not allow excludes. If groups
221
                                 or individuals are specified, then packages which
222
                                 include these groups or individuals are included in
223
                                 the download.
224
                                 URL of the remote Poseidon server.
      --remoteURL URL
225
                                 (default: "https://server.poseidon-adna.org")
226
      --archive STRING
                                 The name of the Poseidon package archive that should
227
                                 be queried. If not given, then the query falls back
                                 to the default archive of the server selected with
229
                                 --remoteURL. See the archive documentation at
230
                                 https://www.poseidon-adna.org/#/archive_overview for
                                 a list of archives currently available from the
232
                                 official Poseidon Web API. (default: Nothing)
233
   It works with
234
   trident fetch -d ... -d ... \
235
      -f "*package_title_1*,*package_title_2-1.0.1*,group_name,<individual1>"
236
   and the entities you want to download must be listed either in a simple string of comma-separated values, which
237
   can be passed via -f/--fetchString, or in a text file (--fetchFile). Entities are then combined from these
238
   sources.
239
   Entities are specified using a special syntax (see also the documentation of forge below): packages are wrapped
240
   in asterisks, with or without version appended after a dash (e.g. *package_title* or *package_title-1.2.3),
241
   group names are spelled as is, and individual names are wrapped in angular brackets (e.g. <individual1>).
   Fetch will figure out which packages need to be downloaded to include all specified entities. --downloadAll,
243
```

which can be given instead of -f and --fetchFile, causes fetch to download all packages from the server. The downloaded packages are added in the first (!) -d directory (which gets created if it doesn't exist), but downloads 245 are only performed if the respective packages are not already present in the latest version in any of the -d dirs. 246 Note that trident fetch makes most sense in combination with trident list --remote: First one can inspect 247 what is available on the server, then one can create a custom fetch command.

fetch also has the optional arguments --remote https:://..." to name an alternative Poseidon server and --archive to select a Poseidon archive on the server. Here is a list of the archives available on the official 250 Poseidon server. 251

1.2.3Forge command

248

264

265

266 267

forge creates new Poseidon packages by extracting and merging packages, populations and individuals/samples 253 from your Poseidon repositories.

Click here for command line details 255

```
Usage: trident forge ((-d|--baseDir DIR) |
256
                            ((-p|--genoOne FILE) | --inFormat FORMAT --genoFile FILE
                              --snpFile FILE --indFile FILE) [--snpSet SET])
258
                          [--forgeFile FILE | (-f|--forgeString DSL)]
259
                         [--selectSnps FILE] [--intersect] [--outFormat FORMAT]
                         [--minimal] [--onlyGeno] (-o|--outPackagePath DIR)
261
                         [-n|--outPackageName STRING] [--packagewise]
262
                         [--outPlinkPopName MODE]
```

Select packages, groups or individuals and create a new Poseidon package from them

Available options:

```
268
      -h,--help
                                Show this help text
269
      -d,--baseDir DIR
                                A base directory to search for Poseidon packages.
270
      -p,--genoOne FILE
                                One of the input genotype data files. Expects .bed,
271
                                .bim or .fam for PLINK and .geno, .snp or .ind for
                                EIGENSTRAT. The other files must be in the same
273
                                directory and must have the same base name.
274
                                The format of the input genotype data: EIGENSTRAT or
      --inFormat FORMAT
275
                                PLINK. Only necessary for data input with --genoFile
276
                                + --snpFile + --indFile.
277
      --genoFile FILE
                                Path to the input geno file.
      --snpFile FILE
                                Path to the input snp file.
279
      --indFile FILE
                                Path to the input ind file.
280
      --snpSet SET
                                The snpSet of the package: 1240K, HumanOrigins or
                                Other. Only relevant for data input with -p|--genoOne
282
                                or --genoFile + --snpFile + --indFile, because the
283
                                packages in a -d|--baseDir already have this
                                information in their respective POSEIDON.yml files.
285
```

(default: Other) 286 --forgeFile FILE A file with a list of packages, groups or individual 287 samples. Works just as -f, but multiple values can 288 also be separated by newline, not just by comma. Empty lines are ignored and comments start with "#", 290 so everything after "#" is ignored in one line. 291 Multiple instances of -f and --forgeFile can be 292 given. They will be evaluated according to their 293 input order on the command line. 294 -f,--forgeString DSL List of packages, groups or individual samples to be 295 combined in the output package. Packages follow the 296 syntax *package_title*, populations/groups are simply 297 group_id and individuals <individual_id>. You can combine multiple values with comma, so for example: 299 "*package_1*, <individual_1>, <individual_2>, 300 group_1". Duplicates are treated as one entry. Negative selection is possible by prepending "-" to 302 the entity you want to exclude (e.g. "*package 1*, 303 -<individual_1>, -group_1"). forge will apply excludes and includes in order. If the first entity 305 is negative, then forge will assume you want to merge 306 all individuals in the packages found in the baseDirs (except the ones explicitly excluded) before the 308 exclude entities are applied. An empty forgeString 309 (and no --forgeFile) will therefore merge all available individuals. If there are individuals in 311 your input packages with equal individual id, but 312 different main group or source package, they can be 313 specified with the special syntax 314 "<package:group:individual>". 315 --selectSnps FILE To extract specific SNPs during this forge operation, 316 provide a Snp file. Can be either Eigenstrat (file 317 ending must be '.snp') or Plink (file ending must be 318 '.bim'). When this option is set, the output package 319 will have exactly the SNPs listed in this file. Any 320 SNP not listed in the file will be excluded. If 321 option '--intersect' is also set, only the SNPs 322 overlapping between the SNP file and the forged 323 packages are output. (default: Nothing) 324 Whether to output the intersection of the genotype --intersect 325 files to be forged. The default (if this option is 326 not set) is to output the union of all SNPs, with 327 genotypes defined as missing in those packages which 328 do not have a SNP that is present in another package.

330

With this option set, the forged dataset will

```
typically have fewer SNPs, but less missingness.
331
                                 The format of the output genotype data: EIGENSTRAT or
      --outFormat FORMAT
332
                                 PLINK. (default: PLINK)
333
      --minimal
                                 Should the output data be reduced to a necessary
334
                                 minimum and omit empty scaffolding?
335
      --onlyGeno
                                 Should only the resulting genotype data be returned?
336
                                 This means the output will not be a Poseidon package.
337
      -o,--outPackagePath DIR
                                 Path to the output package directory.
338
      -n, -- outPackageName STRING
339
                                 The output package name. This is optional: If no name
340
                                 is provided, then the package name defaults to the
341
                                 basename of the (mandatory) --outPackagePath
342
                                 argument. (default: Nothing)
      --packagewise
                                 Skip the within-package selection step in forge. This
344
                                 will result in outputting all individuals in the
345
                                 relevant packages, and hence a superset of the
                                 requested individuals/groups. It may result in better
347
                                 performance in cases where one wants to forge entire
348
                                 packages or almost entire packages. Details: Forge
                                 conceptually performs two types of selection: First,
350
                                 it identifies which packages in the supplied base
351
                                 directories are relevant to the requested forge, i.e.
                                 whether they are either explicitly listed using
353
                                 *PackageName*, or because they contain selected
354
                                 individuals or groups. Second, within each relevant
                                 package, individuals which are not requested are
356
                                 removed. This option skips only the second step, but
357
                                 still performs the first.
358
                                 Where to write the population/group name into the FAM
      --outPlinkPopName MODE
359
                                 file in Plink-format. Three options are possible:
360
                                 asFamily (default) | asPhenotype | asBoth. See also
361
                                 --inPlinkPopName.
362
   forge can be used with
363
   trident forge -d ... -d ... \
      -f "*package_name*, group_id, <individual_id>" \
365
      -o path/to/new_package_name
366
   where the entities (packages, groups/populations, individuals/samples) you want in the output package can be
367
   denoted either as a string on the command line (-f/--forgeString), or in an input text file (--forgeFile).
368
   See the section below for the syntax of this selection language. Do not forget to wrap the --forgeString query
370
   Including one or multiple Poseidon packages with -d is not the only way to include data for a forge operation.
371
   It is also possible to consider unpackaged genotype data directly with -p (+ --snpSet) or --inFormat +
    --genoFile + --snpFile + --indFile (+ --snpSet). This makes the following example possible, where we
373
   merge data from one Poseidon package and two genotype datasets to get a new EIGENSTRAT dataset.
374
```

```
trident forge \
      -d 2017_GonzalesFortesCurrentBiology \
376
      -p 2018_VeeramahPNAS/2018_VeeramahPNAS.fam \
377
      --inFormat PLINK \
378
      --genoFile 2017_HaberAJHG/2017_HaberAJHG.bed \
379
      --snpFile 2017_HaberAJHG/2017_HaberAJHG.bim \
380
      --indFile 2017_HaberAJHG/2017_HaberAJHG.fam \
381
      -f "<STR241.SG>,<ERS1790729.SG>,Iberia_HG.SG" \
382
      -o testpackage \
383
      --outFormat EIGENSTRAT \
      --onlyGeno
385
```

393 394

395

396

397

398

399

400

401

402

1.2.3.1 The forge selection language The text in --forgeString, --forgeFile (and with limited syntax also in --fetchString and --fetchFile) are parsed as a domain specific query language that describes precisely which entities should be compiled in the output package of a given forge operation. The language has multiple syntactic elements and a specific evaluation logic.

In general a --forgeString query consists of multiple entities, separated by ,. The main entities are Poseidon packages, groups/populations and individuals/samples:

- Each package title is surrounded by *: *package*. That means if you want all individuals of the Poseidon
 package 2019_Jeong_InnerEurasia in the output package you would add *2019_Jeong_InnerEurasia*
 to the query.
- Groups/populations are not specially marked: group. So to get all individuals of the group Swiss_Roman_period, you would simply add Swiss_Roman_period.
- Individuals/samples are surrounded by < and >: <individual>. ALA026 therefore becomes <ALA026>. A second way to denote individuals is with the more verbose and specific syntax <package:group:individual>. Such defined individuals take precedence over differently defined ones (so: directly with <individual> or as a subset of *package* or group). This allows to resolve duplication issues precisely at least in cases where the duplicated individuals differ in source package or primary group.
 - $\bullet \ \ \text{Package versions can be appended to package names, such as *package-1.2.3*, or <package-1.2.3:group:individual individual individual$

In the --forgeFile each line is treated as a separate forgeString, empty lines are ignored and #s start comments.

So this is a valid example of a forgeFile:

```
# Packages

*package1*, *package2-1.2.3*

# Groups and individuals from other packages beyond package1 and package2

group1, <individual1>, group2, <individual2>, <pac1:group2:individual3>

# group2 has two outlier individuals that should be ignored

-<individual1> # This one has very low coverage

-<pac2:group3:individual4> # This one is from a different time period
```

By prepending - to entities, we can exclude them from the forged package (this feature is not available for fetch). forge figures out the final list of samples to include by executing all forge-entities in order. So an entity list *PackageA*,-<Individual1>,GroupA may result in a different outcome than

- *PackageA*, GroupA, -<Individual1>, depending on whether <Individual1> belongs to GroupA or not.
- 418 If the forge entity list starts with a negative entity, or if the entity list is empty, forge will implicitly assume
- you want to include all individuals in all **latest** versions of packages found in the base directories (except the
- ones explicitly excluded, of course).
- The specific semantics of the various ways to include or exclude entities are:

1.2.3.1.1 Inclusion queries

424

429

430

432

433

434

438

439

- *Pac1*: Select all individuals in the latest version of package "Pac1"
 - *Pac1-1.0.1*: Select all individuals in package "Pac1" with version "1.0.1"
 - Group1: Select all individuals associated with "Group1" in all latest versions of all packages
- <Ind1>: Select the individual named "Ind1", searching in all latest packages.
- <Pac1:Group1:Ind1>: Select the individual named "Ind1" associated with "Group1" in the latest version of package "Pac1"
 - <Pac1-1.0.1:Group1:Ind1>: Select the individual named "Ind1" associated with "Group1" in the package "Pac1" with version "1.0.1"

1.2.3.1.2 Exclusion queries

- -*Pac1*: Remove all individuals in all versions of package "Pac1"
- -*Pac1-1.0.1*: Remove only individuals in package "Pac1" with version "1.0.1" (but leave other versions in)
- -Group1: Remove all individuals associated with "Group1" in all versions of all packages (not just the latest)
- -<Ind1>: Remove all individuals named "Ind1" in all versions of all packages (not just the latest).
 - -<Pac1:Group1:Ind1>: Remove the individual named "Ind1" associated with "Group1", searching in all versions of package "Pac1"
- -<Pac1-1.0.1:Group1:Ind1>: Remove the individual named "Ind1" associated with "Group1", but only if they are in "Pac1" with version "1.0.1"
- 442 If a query results in multiple individuals with the same name, forge will throw an error.
- 1.2.3.2 Treatment of the .janno file while merging forge merges and subsets .janno files along with the genotype data. If a package lacks a .janno file, then a basic one will be created internally based on the information in the genotype data, and used for the output. Missing columns across packages will be filled with n/a.
- For merging two .janno files **A** and **B** the following rules apply regarding undefined, arbitrary additional columns:
- If **A** has an additional column which is not in **B** then empty cells in the rows imported from **B** are filled with n/a.
- If **A** and **B** share additional columns with identical column name, then they are treated as semantically identical units and merged accordingly.
 - In the resulting .janno file, all additional columns from both **A** and **B** are sorted alphabetically and appended after the normal, specified variables.
- The following example illustrates the described behaviour:

455 A.janno

452

Poseidon_ID	Group_Name	Genetic_Sex	AdditionalColumn1	AdditionalColumn2
XXX011	POP1	M	A	D
XXX012	POP2	F	В	E
XXX013	POP1	M	\mathbf{C}	F

456 B.janno

Poseidon_ID	Group_Name	${\rm Genetic_Sex}$	AdditionalColumn3	AdditionalColumn2
YYY022	POP5	F	G	J
YYY023	POP5	F	H	K
YYY024	POP5	M	I	L

457 $\mathbf{A.janno} + \mathbf{B.janno}$

Poseidon_ID	Group_Name	Genetic_Sex	AdditionalColumn1	AdditionalColumn2	AdditionalColumn3
XXX011	POP1	M	A	D	n/a
XXX012	POP2	F	В	E	n/a
XXX013	POP1	M	C	\mathbf{F}	n/a
YYY022	POP5	F	n/a	J	G
YYY023	POP5	F	n/a	K	H
YYY024	POP5	M	n/a	L	I

1.2.3.3 Treatment of the .ssf file while merging The Sequencing Source File (short .ssf file) is forged in
exactly the same way as the janno file. SSF files that are present are included in the forge product in the way
that the user expects, following selection of those entities which are listed in the poseidon_IDs columns of the
SSF files. Columns that are only present in some packages, including those not defined by our [Schema] are also
included in the forged product in the same way as described for Janno above.

1.2.3.4 Treatment of the .bib file while merging In the forge process all relevant samples for the output package are determined. This includes their .janno entries and therefore the information on the publication keys documented for them in the .janno Publication column. The output .bib file compiles only the relevant references for the samples in the output package. It includes the references exactly once and is sorted alphabetically (by key).

1.2.3.5 Other options Just as for init the output package of forge is created as a new directory -o. The title can also be explicitly defined with -n.

--minimal allows for the creation of a minimal output package without .bib and .janno. This is especially useful for data analysis pipelines, where only the genotype data is required. Even more basic output comes with --onlyGeno, which means that only the genotype data is returned without any Poseidon package.

forge has a an optional flag --intersect, that defines, if the genotype data from different packages should be merged with an **union** or an **intersect** operation. The default (if this option is not set) is to output the union of all SNPs, with genotypes defined as missing in samples from packages which do not have a SNP that is present in another package. With this option set, on the other hand, the forged dataset will typically have fewer SNPs, but less missingness.

--intersect also influences the automatic determination of the snpSet field in the POSEIDON.yml file for the resulting package. If the snpSets of all input packages are identical, then the resulting package will just inherit this configuration. Otherwise forge applies the following pairwise merging logic:

Input snpSet A	Input snpSet B	intersect	Ouput snpSet
Other	*	*	Other
1240K	HumanOrigins	True	HumanOrigins
1240K	HumanOrigins	False	$1240 \mathrm{K}$

--selectSnps allows to provide forge with a SNP file in EIGENSTRAT (.snp) or PLINK (.bim) format to create a package with a specific selection. When this option is set, the output package will have exactly the SNPs listed in this file. Any SNP not listed in the file will be excluded. If --intersect is also set, only the SNPs overlapping between the SNP file and the forged packages are output.

- Merging genotype data across different data sources and file formats is tricky. forge is more verbose about potential issues, if the --logMode flag is set to VerboseLog.
- The --onlyGeno command specifies that only genotype data should be output, not an entire Poseidon package.
- With --packagewise the within-package selection step in forge can be skipped. This will result in outputting all individuals in the relevant packages, and hence a superset of the requested individuals/groups. It may result in better performance in cases where one wants to forge entire packages.

491 1.2.4 Genoconvert command

492 genoconvert converts the genotype data in a Poseidon package to a different file format. The respective entries
493 in the POSEIDON.yml file are changed accordingly.

494 Click here for command line details

```
Usage: trident genoconvert ((-d|--baseDir DIR) |

((-p|--genoOne FILE) | --inFormat FORMAT

--genoFile FILE --snpFile FILE --indFile FILE)

[--snpSet SET]) --outFormat FORMAT [--onlyGeno]

[-o|--outPackagePath DIR] [--removeOld]

[--outPlinkPopName MODE] [--onlyLatest]
```

Convert the genotype data in a Poseidon package to a different file format

```
4 Available options:
```

502 503

505

506

508

509

```
-h,--help Show this help text
-d,--baseDir DIR A base directory to search for Poseidon packages.
-p,--genoOne FILE One of the input genotype data files. Expects .bed,
.bim or .fam for PLINK and .geno, .snp or .ind for
EIGENSTRAT. The other files must be in the same
directory and must have the same base name.
```

```
The format of the input genotype data: EIGENSTRAT or
      --inFormat FORMAT
511
                                 PLINK. Only necessary for data input with --genoFile
512
                                 + --snpFile + --indFile.
513
      --genoFile FILE
                                 Path to the input geno file.
514
      --snpFile FILE
                                 Path to the input snp file.
515
      --indFile FILE
                                 Path to the input ind file.
516
      --snpSet SET
                                 The snpSet of the package: 1240K, HumanOrigins or
517
                                 Other. Only relevant for data input with -p|--genoOne
518
                                 or --genoFile + --snpFile + --indFile, because the
519
                                 packages in a -d|--baseDir already have this
520
                                 information in their respective POSEIDON.yml files.
521
                                 (default: Other)
522
      --outFormat FORMAT
                                 the format of the output genotype data: EIGENSTRAT or
523
                                 PLINK.
524
      --onlyGeno
                                 Should only the resulting genotype data be returned?
525
                                 This means the output will not be a Poseidon package.
      -o,--outPackagePath DIR
                                 Path to the output package directory. This is
527
                                 optional: If no path is provided, then the output is
528
                                 written to the directories where the input genotype
                                 data file (.bed/.geno) is stored. (default: Nothing)
530
531
      --removeOld
                                 Remove the old genotype files when creating the new
                                 ones.
532
      --outPlinkPopName MODE
                                 Where to write the population/group name into the FAM
533
                                 file in Plink-format. Three options are possible:
534
                                 asFamily (default) | asPhenotype | asBoth. See also
535
                                 --inPlinkPopName.
536
      --onlyLatest
                                 Consider only the latest versions of packages, or the
537
                                 groups and individuals within the latest versions of
538
                                 packages, respectively.
539
   With the default setting
540
   trident genoconvert -d ... -d ... --outFormat EIGENSTRAT|PLINK
   all packages in -d will be converted to the desired --outFormat (either EIGENSTRAT or PLINK), if the data is
542
   not already in this format. This includes updating the respective POSEIDON.yml files.
   The "old" data is not deleted, but kept around. That means conversion can result in a package with both PLINK
544
   and EIGENSTRAT data, but only one is linked in the POSEIDON.yml file, and that is what will be used by
545
   trident. To delete the old data in the conversion you can add the --removeOld flag.
546
   Instead of -d to change Poseidon packages, the -p (+ --snpSet) or --inFormat + --genoFile + --snpFile
547
   + --indFile (+ --snpSet) allow to directly convert genotype data that is not wrapped in a Poseidon package
   and store it to a directory given in -o. See this example:
549
   trident genoconvert \
550
      -p 2018_Mittnik_Baltic/Mittnik_Baltic.bed \
551
      --outFormat EIGENSTRAT
552
```

-o my_directory

54 1.2.5 Rectify command

555

```
update from one Poseidon version to the next, but rather a clean-up wizard after manual modifications.
556
   Click here for command line details
557
   Usage: trident rectify (-d|--baseDir DIR) [--ignorePoseidonVersion]
                             [--poseidonVersion ?.?.?]
559
                             [--packageVersion VPART [--logText STRING]]
560
                             [--checksumAll | [--checksumGeno] [--checksumJanno]
                               [--checksumSSF] [--checksumBib]]
562
                             [--newContributors DSL] [--onlyLatest]
563
      Adjust POSEIDON.yml files automatically to package changes
565
566
   Available options:
      -h,--help
                                 Show this help text
568
      -d,--baseDir DIR
                                 A base directory to search for Poseidon packages.
569
      --ignorePoseidonVersion
                                 Read packages even if their poseidonVersion is not
                                 compatible with trident.
571
                                 Poseidon version the packages should be updated to:
      --poseidonVersion ?.?.?
572
                                 e.g. "2.5.3".
573
      --packageVersion VPART
                                 Part of the package version number in the
574
                                 POSEIDON.yml file that should be updated: Major,
575
                                 Minor or Patch (see https://semver.org).
576
      --logText STRING
                                 Log text for this version in the CHANGELOG file.
577
      --checksumAll
                                 Update all checksums.
578
      --checksumGeno
                                 Update genotype data checksums.
579
      --checksumJanno
                                 Update .janno file checksum.
580
      --checksumSSF
                                 Update .ssf file checksum
581
      --checksumBib
                                 Update .bib file checksum.
582
      --newContributors DSL
                                 Contributors to add to the POSEIDON.yml file in the
583
                                 form "[Firstname Lastname] (Email address);...".
584
                                 Consider only the latest versions of packages, or the
      --onlyLatest
585
                                 groups and individuals within the latest versions of
586
                                 packages, respectively.
587
   It can be called with a lot of optional arguments:
588
    trident rectify -d ... -d ... \
589
      --poseidonVersion "X.X.X" \
590
      --packageVersion Major|Minor|Patch \
      --logText "short description of the update"
592
      --checksumAll
593
      --newContributors "[Firstname Lastname] (Email address);..."
```

rectify automatically harmonizes POSEIDON.yml files of one or multiple packages. This is not an automatic

These arguments determine which fields of the POSEIDON.yml file should be modified.

- --poseidonVersion allows a simple change of the poseidonVersion field in the POSEIDON.yml file.
- --packageVersion increments the package version number in the first, the second or the third position. It can optionally be called with --logText, which appends an entry to the CHANGELOG file for the respecitve package version update. --logText also creates a new CHANGELOG file if it does not exist yet.
- --checksumGeno, --checksumJanno, --checksumSSF and --checksumBib add or modify the respective checksum fields in the POSEIDON.yml file. --checksumAll is a wrapper to call all of them at once.
- --newContributors adds new contributors.

:warning: As rectify reads and rewrites POSEIDON.yml files, it may change their inner order, layout or even content (e.g. if they have fields which are not in the POSEIDON.yml definition). Create a backup of the 605 POSEIDON.yml file before running rectify if you are uncertain if this might affect you negatively. 606

```
Usage: trident list ((-d|--baseDir DIR) | --remote [--remoteURL URL]
611
                           [--archive STRING])
612
                         (--packages | --groups | --individuals
613
                           [-j|--jannoColumn COLNAME]) [--raw] [--onlyLatest]
614
```

List packages, groups or individuals from local or remote Poseidon repositories

Show this help text

Available options: 619 -h,--help

```
-d,--baseDir DIR
                                A base directory to search for Poseidon packages.
621
      --remote
                                List packages from a remote server instead the local
622
                                file system.
623
      --remoteURL URL
                                URL of the remote Poseidon server.
                                (default: "https://server.poseidon-adna.org")
625
      --archive STRING
                                The name of the Poseidon package archive that should
626
                                be queried. If not given, then the query falls back
                                to the default archive of the server selected with
628
                                --remoteURL. See the archive documentation at
629
                                https://www.poseidon-adna.org/#/archive_overview for
630
                                a list of archives currently available from the
631
                                official Poseidon Web API. (default: Nothing)
632
                                List all packages.
      --packages
633
                                List all groups, ignoring any group names after the
      --groups
634
                                first as specified in the .janno-file.
635
                                List all individuals/samples.
      --individuals
636
      -j,--jannoColumn COLNAME List additional fields from the janno files, using
637
```

```
the .janno column heading name, such as "Country",
638
                                   "Site", "Date_C14_Uncal_BP", etc..
639
                                   Return the output table as tab-separated values
      --raw
640
                                   without header. This is useful for piping into grep
641
                                   or awk.
642
      --onlyLatest
                                   Consider only the latest versions of packages, or the
643
                                   groups and individuals within the latest versions of
644
                                   packages, respectively.
645
   To list packages from your local repositories, as seen above you can run
    trident list -d ... -d ... --packages
647
    This will yield a nicely formatted table of all packages, their version and the number of individuals in them.
648
    You can use --remote to show packages on the remote server. For example
649
    trident list --packages --remote --archive "community-archive"
650
    will result in a view of all packages available in one of the public online archives. Just as for fetch, the --archive
651
   flag allows to choose which public archive to query.
652
    Independent of whether you query a local or an online archive, you can not just list packages, but also groups,
    as defined in the third column of EIGENSTRAT .ind files (or the first/last column of a PLINK .fam file), and
654
   individuals with the flags --groups and --individuals (instead of --packages).
655
   The --individuals flag additionally provides a way to immediately access information from .janno files
656
    on the command line. This works with the -j/--jannoColumn option. For example adding -j Country -j
657
   Date_C14_Uncal_BP to the commands above will add the Country and the Date_C14_Uncal_BP columns to the
658
    respective output tables.
659
    Note that if you want a less fancy table, for example because you want to load this into Excel, or pipe into
660
    another command that cannot deal with the table layout, you can use the --raw option to output that table as
661
   a simple tab-delimited stream.
662
           Summarise command
663
    summarise prints some general summary statistics for a given poseidon dataset taken from the .janno files.
    Click here for command line details
665
    Usage: trident summarise (-d|--baseDir DIR) [--raw]
667
```

Get an overview over the content of one or multiple Poseidon packages

670 Available options:

668

671

673

674

675

-h,--help Show this help text

d,--baseDir DIR A base directory to search for Poseidon packages.

--raw Return the output table as tab-separated values

without header. This is useful for piping into grep

or awk.

You can run it with

```
trident summarise -d ... -d ...
    which will show you context information like – among others – the number of individuals in the dataset, their
678
   sex distribution, the mean age of the samples (for ancient data) or the mean coverage on the 1240K SNP array
    in a table. summarise depends on complete .janno files and will silently ignore missing information.
680
    You can use the --raw option to output the summary table in a simple, tab-delimited layout.
681
    1.3.3 Survey command
    survey tries to indicate package completeness (mostly focused on .janno files) for poseidon datasets.
683
    Click here for command line details
    Usage: trident survey (-d|--baseDir DIR) [--raw] [--onlyLatest]
685
      Survey the degree of context information completeness for Poseidon packages
687
    Available options:
689
      -h,--help
                                  Show this help text
690
      -d,--baseDir DIR
                                  A base directory to search for Poseidon packages.
691
      --raw
                                  Return the output table as tab-separated values
692
                                  without header. This is useful for piping into grep
693
                                  or awk.
694
      --onlyLatest
                                  Consider only the latest versions of packages, or the
695
                                  groups and individuals within the latest versions of
696
                                  packages, respectively.
697
   Running
    trident survey -d ... -d ...
699
    will yield a table with one row for each package. See trident survey -h for a legend which cell of this table
    means what.
701
    Again you can use the --raw option to output the survey table in a tab-delimited format.
702
    1.3.4 Validate command
    validate checks Poseidon packages and indivudual package components for structural correctness.
704
    Click here for command line details
    Usage: trident validate ((-d|--baseDir DIR) [--ignoreGeno] [--fullGeno]
706
                                 [--ignoreDuplicates] [-c|--ignoreChecksums]
707
                                 [--ignorePoseidonVersion] |
708
                                 --pyml FILE | (-p|--genoOne FILE) | --inFormat FORMAT
709
                                 --genoFile FILE --snpFile FILE --indFile FILE |
710
                                 --janno FILE | --ssf FILE | --bib FILE) [--noExitCode]
```

Check Poseidon packages or package components for structural correctness

[--onlyLatest]

711

712 713

```
Available options:
716
      -h,--help
                                 Show this help text
717
      -d,--baseDir DIR
                                 A base directory to search for Poseidon packages.
718
      --ignoreGeno
                                 Ignore snp and geno file.
719
      --fullGeno
                                 Test parsing of all SNPs (by default only the first
720
                                  100 SNPs are probed).
721
      --ignoreDuplicates
                                 Do not stop on duplicated individual names in the
722
                                 package collection.
723
      -c,--ignoreChecksums
                                 Whether to ignore checksums. Useful for speedup in
724
                                 debugging.
725
      --ignorePoseidonVersion
                                 Read packages even if their poseidonVersion is not
726
                                  compatible with trident.
727
      --pyml FILE
                                 Path to a POSEIDON.yml file.
728
      -p,--genoOne FILE
                                 One of the input genotype data files. Expects .bed,
729
                                  .bim or .fam for PLINK and .geno, .snp or .ind for
730
                                 EIGENSTRAT. The other files must be in the same
731
                                 directory and must have the same base name.
732
      --inFormat FORMAT
                                 The format of the input genotype data: EIGENSTRAT or
733
                                 PLINK. Only necessary for data input with --genoFile
734
                                 + --snpFile + --indFile.
735
      --genoFile FILE
                                 Path to the input geno file.
736
                                 Path to the input snp file.
      --snpFile FILE
737
      --indFile FILE
                                 Path to the input ind file.
738
      -- janno FILE
                                 Path to a .janno file.
739
                                 Path to a .ssf file.
      --ssf FILE
740
                                 Path to a .bib file.
      --bib FILE
741
      --noExitCode
                                 Do not produce an explicit exit code.
742
                                 Consider only the latest versions of packages, or the
      --onlyLatest
743
                                 groups and individuals within the latest versions of
744
                                 packages, respectively.
745
   You can run it with
   trident validate -d ... -d ...
747
   to check packages and it will either report a success (Validation passed) or failure with specific error messages.
   Instead of validating entire packages with -d you can also apply it to individual files and package com-
749
   ponents: --pyml (POSEIDON.yml), -p | --inFormat + --genoFile + --snpFile + --indFile (genotype
750
   data), --janno (.janno file), --ssf (.ssf file) or --bib (.bib file). In this case validate attempts to read and
751
   parse the respective files individually and reports any issues it encounters. Note that this considers the files in
752
   isolation and does not include any cross-file consistency checks.
753
```

- When applied to packages, validate tries to ensure that each package adheres to the schema definition. Here is a list of what is checked:
 - Structural correctness of the POSEIDON.yml file.

756

757

- Presence of all files references in the POSEIDON.yml file.
- Full structural correctness of .janno, .ssf and .bib file.

- Superficial correctness of genotype data files by parsing the first 100 SNPs. A full check that parses all SNPs can be triggered with the --fullGeno option. --ignoreGeno, on the other hand, causes validate to ignore the genotype data entirely, which speeds up the validation significantly.
 - Correspondence of BibTeX keys in .bib and .janno
 - Correspondence of sample IDs in .janno and .ssf.

759

760

761

762

763

764

• Correspondence of sample and group IDs in .janno and genotype data files.

In fact much of this validation already runs as part of the general package reading pipeline invoked for other trident subcommands (e.g. forge). validate is meant to be more thorough/brittle, though, and will explicitly fail if even a single package is broken. For special cases more flexibility can be enabled with the options

--ignoreDuplicates, --ignoreChecksums and --ignorePoseidonVersion.

Remember to run validate it with --debug to get more information in case the default output is not sufficient to analyse an issue.
