25	1	\mathbf{T}	The trident CLI	
26	Tri	ident	is a command line software tool structured in multiple subcommands. If you installed it properly y	ou/
27	caı	n call	it on the command line by typing $\verb trident $. This will show an overview of the general options and	all
28	sul	bcom	mands, which are explained in detail below.	
29	Us	age:	trident [version] [logMode ARG] [errLength ARG]	
30			[inPlinkPopName ARG] (COMMAND COMMAND)	
31		tride	ent is a management and analysis tool for Poseidon packages. Report issues	
32]	here	: https://github.com/poseidon-framework/poseidon-hs/issues	

```
Available options:
     -h,--help
                                Show this help text
35
     --version
                                Show version number
36
     --logMode ARG
                                How information should be reported: NoLog, SimpleLog,
37
                                DefaultLog, ServerLog or VerboseLog
38
                                 (default: DefaultLog)
39
     --errLength ARG
                                 After how many characters should a potential error
40
                                message be truncated. "Inf" for no truncation.
41
                                 (default: CharCount 1500)
42
     --inPlinkPopName ARG
                                Where to read the population/group name from the FAM
43
                                file in Plink-format. Three options are possible:
44
                                asFamily (default) | asPhenotype | asBoth.
45
   Package creation and manipulation commands:
47
     init
                                Create a new Poseidon package from genotype data
48
     fetch
                                Download data from a remote Poseidon repository
                                Select packages, groups or individuals and create a
     forge
50
                                new Poseidon package from them
51
                                Convert the genotype data in a Poseidon package to a
     genoconvert
52
                                different file format
53
                                Update POSEIDON.yml files automatically
     update
54
   Inspection commands:
56
     list
                                List packages, groups or individuals from local or
57
                                remote Poseidon repositories
     summarise
                                Get an overview over the content of one or multiple
59
                                Poseidon packages
60
                                Synonym for summarise
     summarize
61
                                Survey the degree of context information completeness
     survey
62
                                for Poseidon packages
63
                                Check one or multiple Poseidon packages for
     validate
                                 structural correctness
   Trident allows to work directly with genotype data (see -p below), but its optimized for the interaction
   with Poseidon packages, which wrap and contextualize the data. Most trident subcommands therefore have a
   central parameter, called --baseDir or simply -d to specify one or more base directories to look for packages.
68
   For example, if all Poseidon packages live inside a repository at /path/to/poseidon/packages you would
   simply say trident <subcommand> -d /path/to/poseidon/dirs/ and trident would automatically search
   all subdirectories inside of the repository for valid Poseidon packages (as identified by valid POSEIDON.yml
71
   files).
72
   You can arrange a poseidon repository in a hierarchical way. For example:
73
   /path/to/poseidon/packages
74
       /modern
75
            /2019_poseidon_package1
76
```

/2019_poseidon_package2

```
/ancient
78
             /...
79
             /...
80
        /Reference_Genomes
81
             /...
82
             /...
83
    You can use this structure to select only the level of packages you're interested in, even individual ones, and you
    can make use of the fact that -d can be given multiple times.
85
    Being able to specify one or multiple repositories is often not enough, as you may have your own data to
    co-analyse with the main repository. This is easy to do, as you simply need to provide your own genotype data
87
    as yet another Poseidon package to be added to your trident command. For example, let's say you have
88
    genotype data in EIGENSTRAT format (trident supports EIGENSTRAT and PLINK as formats.):
    ~/my_project/my_project.geno
    ~/my_project/my_project.snp
91
    ~/my_project/my_project.ind
    then you can make that to a skeleton Poseidon package with the init command. You can also do it manually
93
    by simply adding a POSEIDON.yml file, with for example the following content:
    poseidonVersion: 2.5.0
    title: My_awesome_project
    description: Unpublished genetic data from my awesome project
    contributor:
98
      - name: Stephan Schiffels
99
        email: schiffels@institute.org
100
   packageVersion: 0.1.0
101
   lastModified: 2020-10-07
102
    genotypeData:
103
      format: EIGENSTRAT
104
      genoFile: my_project.geno
105
      snpFile: my_project.snp
106
      indFile: my_project.ind
107
    jannoFile: my_project.janno
108
    bibFile: sources.bib
109
    Two remarks: 1) all file paths are considered relative to the directory in which POSEIDON.yml resides. Here we
110
    assume that you put this file into the same directory as the three genotype files. 2) Besides the genotype data
111
    files there are two (technically optional) files referenced by this example POSEIDON.yml file: sources.bib
112
   and my_project.janno. Of course you can add them manually - init automatically creates empty dummy
113
    versions.
114
    Once you have set up your own "Poseidon" package (which is really only a skeleton so far), you can add it to
115
   your trident analysis, by simply adding your project directory to the command using -d, for example:
116
    trident list -d /path/to/poseidon/packages/modern \
117
      -d /path/to/poseidon/packages/ReferenceGenomes
118
```

-d ~/my_project --packages

136

137

1.1.1 Logging and command line output

For all subcommands the general argument --logMode defines how trident reports messages (to stderr) on the command line:

- NoLog: Hides all messages.
- SimpleLog: Plain and simple output to stderr.
- DefaultLog: Adds severity indicators before each message. (default setting)
- ServerLog: Additionally adds timestamps before each message.
 - VerboseLog: Shows not just messages on the log levels Info, Warning and Error like the other modes, but also on the more verbose level Debug. Use this for debugging.

130 1.1.2 Duplicates

- If multiple packages in a package repository share the same title, then trident will try to select the one with the highest version number. If this is not sufficient to resolve the conflict, trident will stop.
- Individual/sample names (Poseidon_IDs) within one package have to be unique, or trident will stop.
- We generally also discourage ID duplicates across packages in package repositories, but trident will generally continue with them after printing a warning. This does not apply for validate, by default (you can change this behaviour with --ignoreDuplicates), and forge forge offers a special mechanism to resolve duplicates within its selection language (see below).

1.1.3 Group names in .fam files

The .fam file of Plink-formatted genotype data is used inconsistently across different popular aDNA software tools to store group/population name information. The (global) option --inPlinkPopName with the arguments asFamily (default), asPhenotype and asBoth allows to control the reading of the population name from Plink .fam files. The subcommands that write genotype data (forge, genoconvert) have a corresponding option --outPlinkPopName to specify this for the output.

1.1.4 Whitespaces in the .janno file

While reading the .janno file trident trims all leading and trailing whitespaces around individual cells. Also all instances of the No-Break Space unicode character will be removed. This means these whitespaces will not be preserved when a package is forge d.

¹⁴⁸ 2 Package creation and manipulation commands

149 2.1 Init command

init creates a new, valid Poseidon package from genotype data files. It adds a valid POSEIDON.yml file, a dummy .janno file for context information and an empty .bib file for literature references.

152 Click here for command line details

```
Usage: trident init ((-p|--genoOne ARG) | --inFormat ARG --genoFile ARG --snpFile ARG --indFile ARG) [--snpSet ARG]

(-o|--outPackagePath ARG) [-n|--outPackageName ARG]
```

```
[--minimal]
156
      Create a new Poseidon package from genotype data
157
158
   Available options:
159
      -h,--help
                                 Show this help text
160
      -p,--genoOne ARG
                                 one of the input genotype data files. Expects .bed or
161
                                 .bim or .fam for PLINK and .geno or .snp or .ind for
162
                                 EIGENSTRAT. The other files must be in the same
163
                                 directory and must have the same base name
164
                                 the format of the input genotype data: EIGENSTRAT or
      --inFormat ARG
165
                                 PLINK (only necessary for data input with --genoFile
166
                                 + --snpFile + --indFile)
167
      --genoFile ARG
                                 the input geno file path
168
      --snpFile ARG
                                 the input snp file path
169
      --indFile ARG
                                 the input ind file path
170
      --snpSet ARG
                                 the snpSet of the package: 1240K, HumanOrigins or
171
                                 Other. (only relevant for data input with
172
                                 -p|--genoOne or --genoFile + --snpFile + --indFile,
173
                                 because the packages in a -d|--baseDir already have
                                 this information in their respective POSEIDON.yml
175
                                 files) Default: Other
176
                                 the output package directory path
      -o,--outPackagePath ARG
177
      -n, -- outPackageName ARG
                                 the output package name - this is optional: If no
178
                                 name is provided, then the package name defaults to
179
                                 the basename of the (mandatory) --outPackagePath
180
                                 argument
181
      --minimal
                                 should only a minimal output package be created?
182
   The command
    trident init \
184
      --inFormat EIGENSTRAT/PLINK \
185
      --genoFile path/to/geno_file \
186
      --snpFile path/to/snp_file \
187
      --indFile path/to/ind_file \
188
      --snpSet 1240K|HumanOrigins|Other \
189
      -o path/to/new_package_name
190
   requires the format ( --inFormat ) of your input data (either EIGENSTRAT or PLINK), the paths to the
   respective files (--genoFile, --snpFile, --indFile), and optionally the "shape" of these files (--snpSet),
192
   so if they cover the 1240K, the HumanOrigins or an Other SNP set. A simpler interface added in trident
193
   0.29.0 is available with -p (+ --snpSet).
```

	EIGENSTRAT	PLINK
genoFile	.geno	.bed
${\rm snpFile}$.snp	$. \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\$
$\operatorname{indFile}$.ind	.fam

The output package of init is created as a new directory -o, which should not already exist, and gets the package title corresponding to the basename of -o. You can also set the title explicitly with -n. The --minimal flag causes init to create a minimal package with a very basic POSEIDON.yml and no .bib and .janno files.

```
Fetch command
   2.2
199
    fetch allows to download Poseidon packages from a remote Poseidon server. Read more about this repository
200
201
   Click here for command line details
202
   Usage: trident fetch (-d|--baseDir DIR)
203
                          (--downloadAll |
204
                             (--fetchFile ARG | (-f|--fetchString ARG)))
205
                           [--remoteURL ARG] [-u|--upgrade]
206
     Download data from a remote Poseidon repository
207
208
    Available options:
209
      -h,--help
                                 Show this help text
210
      -d,--baseDir DIR
                                 a base directory to search for Poseidon Packages
211
                                 (could be a Poseidon repository)
      --downloadAll
                                 download all packages the server is offering
213
      --fetchFile ARG
                                 A file with a list of packages. Works just as -f, but
214
                                 multiple values can also be separated by newline, not
215
                                 just by comma. -f and --fetchFile can be combined.
216
      -f,--fetchString ARG
                                 List of packages to be downloaded from the remote
217
                                 server. Package names should be wrapped in asterisks:
218
                                 *package title*. You can combine multiple values with
219
                                 comma, so for example: "*package_1*, *package_2*,
220
                                 *package_3*". fetchString uses the same parser as
221
                                 forgeString, but does not allow excludes. If groups
222
                                 or individuals are specified, then packages which
223
                                 include these groups or individuals are included in
                                 the download.
225
      --remoteURL ARG
                                 URL of the remote Poseidon server
226
                                 (default: "https://c107-224.cloud.gwdg.de")
      -u,--upgrade
                                 overwrite outdated local package versions
228
   It works with
229
   trident fetch -d ... -d ... \
230
      -f "*package_title_1*,*package_title_2*,*package_title_3*,group_name,<Individual1>"
231
   and the entities you want to download must be listed either in a simple string of comma-separated values, which
   can be passed via -f / --fetchString, or in a text file ( --fetchFile ). Entities are then combined from
233
   these sources.
234
```

Entities are specified using a special syntax (see also the documentation of forge below): Package titles

are wrapped in asterisks: package_title, group names are spelled as is, and individual names are wrapped in angular brackets, liks <Individual1>. Fetch will figure out which packages need to be downloaded to include all specified entities. --downloadAll, which can be given instead of -f and --fetchFile, causes fetch to download all packages from the server. The downloaded packages are added in the first (!) -d directory (which gets created if it doesn't exist), but downloads are only performed if the respective packages are not already present in an up-to-date version in any of the -d dirs.

Note that trident fetch makes most sense in combination with trident list --remote: First one can inspect what is available on the server, then one can create a custom fetch command.

fetch also has the optional arguments --remote https:://..." to name an alternative poseidon server.

The default points to the DAG server.

To overwrite outdated package versions with fetch, the -u / --upgrade flag has to be set. Note that many file systems do not offer a way to recover overwritten files. So be careful with this switch.

2.3 Forge command

248

260

261 262

forge creates new Poseidon packages by extracting and merging packages, populations and individuals from your Poseidon repositories.

²⁵¹ Click here for command line details

```
Usage: trident forge ((-d|--baseDir DIR) |

((-p|--genoOne ARG) | --inFormat ARG --genoFile ARG

--snpFile ARG --indFile ARG) [--snpSet ARG])

[--forgeFile ARG | (-f|--forgeString ARG)]

[--selectSnps ARG] [--intersect] [--outFormat ARG]

[--minimal] [--onlyGeno] (-o|--outPackagePath ARG)

[-n|--outPackageName ARG] [--packagewise]

[--outPlinkPopName ARG]
```

Select packages, groups or individuals and create a new Poseidon package from them

```
Available options:
263
      -h,--help
                                Show this help text
      -d,--baseDir DIR
                                a base directory to search for Poseidon Packages
265
                                (could be a Poseidon repository)
                                one of the input genotype data files. Expects .bed or
      -p,--genoOne ARG
                                .bim or .fam for PLINK and .geno or .snp or .ind for
268
                                EIGENSTRAT. The other files must be in the same
269
                                directory and must have the same base name
                                the format of the input genotype data: EIGENSTRAT or
      --inFormat ARG
271
                                PLINK (only necessary for data input with --genoFile
272
                                + --snpFile + --indFile)
      --genoFile ARG
                                the input geno file path
274
      --snpFile ARG
                                the input snp file path
275
      --indFile ARG
                                the input ind file path
276
      --snpSet ARG
                                the snpSet of the package: 1240K, HumanOrigins or
277
```

Other. (only relevant for data input with -p|--genoOne or --genoFile + --snpFile + --indFile, 279 because the packages in a -d|--baseDir already have 280 this information in their respective POSEIDON.yml 281 files) Default: Other 282 --forgeFile ARG A file with a list of packages, groups or individual 283 samples. Works just as -f, but multiple values can also be separated by newline, not just by comma. 285 Empty lines are ignored and comments start with "#", 286 so everything after "#" is ignored in one line. 287 Multiple instances of -f and --forgeFile can be 288 given. They will be evaluated according to their 289 input order on the command line. -f,--forgeString ARG List of packages, groups or individual samples to be 291 combined in the output package. Packages follow the 292 syntax *package_title*, populations/groups are simply group id and individuals <individual id>. You can 294 combine multiple values with comma, so for example: 295 "*package_1*, <individual_1>, <individual_2>, group_1". Duplicates are treated as one entry. 297 Negative selection is possible by prepending "-" to 298 the entity you want to exclude (e.g. "*package_1*, -<individual_1>, -group_1"). forge will apply 300 excludes and includes in order. If the first entity 301 is negative, then forge will assume you want to merge all individuals in the packages found in the baseDirs 303 (except the ones explicitly excluded) before the 304 exclude entities are applied. An empty forgeString 305 (and no --forgeFile) will therefore merge all 306 available individuals. If there are individuals in 307 your input packages with equal individual id, but different main group or source package, they can be 309 specified with the special syntax 310 "<package:group:individual>". 311 To extract specific SNPs during this forge operation, 312 --selectSnps ARG provide a Snp file. Can be either Eigenstrat (file 313 ending must be '.snp') or Plink (file ending must be 314 '.bim'). When this option is set, the output package 315 will have exactly the SNPs listed in this file. Any 316 SNP not listed in the file will be excluded. If 317 option '--intersect' is also set, only the SNPs 318 overlapping between the SNP file and the forged 319 packages are output. 320 Whether to output the intersection of the genotype --intersect 321

322

files to be forged. The default (if this option is

```
not set) is to output the union of all SNPs, with
323
                                 genotypes defined as missing in those packages which
324
                                 do not have a SNP that is present in another package.
325
                                 With this option set, the forged dataset will
326
                                 typically have fewer SNPs, but less missingness.
327
      --outFormat ARG
                                 the format of the output genotype data: EIGENSTRAT or
328
                                 PLINK. Default: PLINK
329
      --minimal
                                 should only a minimal output package be created?
330
      --onlyGeno
                                 should only the resulting genotype data be returned?
331
                                 This means the output will not be a Poseidon package
332
      -o, -- outPackagePath ARG
                                 the output package directory path
333
      -n, -- outPackageName ARG
                                 the output package name - this is optional: If no
334
                                 name is provided, then the package name defaults to
                                 the basename of the (mandatory) --outPackagePath
336
                                 argument
337
      --packagewise
                                 Skip the within-package selection step in forge. This
338
                                 will result in outputting all individuals in the
339
                                 relevant packages, and hence a superset of the
340
                                 requested individuals/groups. It may result in better
                                 performance in cases where one wants to forge entire
342
                                 packages or almost entire packages. Details: Forge
343
                                 conceptually performs two types of selection: First,
                                 it identifies which packages in the supplied base
345
                                 directories are relevant to the requested forge, i.e.
346
                                 whether they are either explicitly listed using
                                 *PackageName*, or because they contain selected
348
                                 individuals or groups. Second, within each relevant
349
                                 package, individuals which are not requested are
350
                                 removed. This option skips only the second step, but
351
                                 still performs the first.
352
      --outPlinkPopName ARG
                                Where to write the population/group name into the FAM
353
                                 file in Plink-format. Three options are possible:
354
                                 asFamily (default) | asPhenotype | asBoth. See also
355
                                 --inPlinkPopName.
356
    forge can be used with
357
   trident forge -d ... -d ... \
358
      -f "*package_name*, group_id, <individual_id>" \
359
      -o path/to/new_package_name
360
   where the entities (packages, groups/populations, individuals/samples) you want in the output package can be
   denoted either as a string on the command line (-f / --forgeString), or in an input text file (--forgeFile).
362
   See the section below for the syntax of this selection language. Do not forget to wrap the --forgeString query
363
   in quotes.
364
   Including one or multiple Poseidon packages with -d is not the only way to include data for a forge
   operation. It is also possible to consider unpackaged genotype data directly with -p (+ --snpSet) or
```

```
possible, where we merge data from one Poseidon package and two genotype datasets to get a new EIGENSTRAT
368
   dataset.
   trident forge \
370
      -d 2017_GonzalesFortesCurrentBiology \
371
      -p 2018_VeeramahPNAS/2018_VeeramahPNAS.fam \
      --inFormat PLINK \
373
      --genoFile 2017_HaberAJHG/2017_HaberAJHG.bed \
374
      --snpFile 2017_HaberAJHG/2017_HaberAJHG.bim \
      --indFile 2017_HaberAJHG/2017_HaberAJHG.fam \
376
      -f "<STR241.SG>,<ERS1790729.SG>,Iberia HG.SG" \
377
      -o testpackage \
378
      --outFormat EIGENSTRAT \
379
      --onlyGeno
380
```

--inFormat + --genoFile + --snpFile + --indFile (+ --snpSet) . This makes the following example

381 2.3.1 The forge selection language

387

388

390

391

393

394

396

397

The text in --forgeString and --forgeFile are parsed as a domain specific query language that describes precisely which entities should be compiled in the output package of a given forge operation. The language has multiple syntactic elements and a specific evaluation logic.

In general a --forgeString query consists of multiple entities, separated by , . The main entities are Poseidon packages, groups/populations and individuals/samples:

- Each package title is surrounded by *: *package*. That means if you want all individuals of the Poseidon package 2019_Jeong_InnerEurasia in the output package you would add *2019_Jeong_InnerEurasia* to the query.
- Groups/populations are not specially marked: group. So to get all individuals of the group Swiss_Roman_period, you would simply add Swiss_Roman_period.
- Individuals/samples are surrounded by < and >: <individual>. ALA026 therefore becomes <ALA026>. A second way to denote individuals is with the more verbose and specific syntax <package:group:individual>. Such defined individuals take precedence over differently defined ones (so: directly with <individual> or as a subset of *package* or group). This allows to resolve duplication issues precisely at least in cases where the duplicated individuals differ in source package or primary group.

In the --forgeFile each line is treated as a separate forgeString, empty lines are ignored and #s start comments. So this is a valid forgeFile:

```
# Packages
# Package1*, *package2*

# Groups and individuals from other packages beyond package1 and package2
group1, <individual1>, group2, <individual2>, <individual3>

# group2 has two outlier individuals that should be ignored
-<bad_individual1> # This one has very low coverage
-<bad_individual2> # This one is from a different time period
```

By prepending - to the bad individuals, we can exclude them from the forged package. forge figures out the final list of samples to include by executing all forge-entities in order. So an entity list

PackageA,-<Individual1>,GroupA may result in a different outcome than *PackageA*,GroupA,-<Individual1>,

depending on whether <Individual1> belongs to GroupA or not. If the forge entity list starts with a negative entity, or if the entity list is empty, forge will implicitly assume you want to include all individuals in all packages found in the baseDirs (except the ones explicitly excluded, of course).

An empty forgeString will therefore merge all available individuals.

2.3.2 Treatment of the .janno file while merging

forge merges and subsets .janno files along with the genotype data. If a package lacks a .janno file, then a
basic one will be created internally based on the information in the genotype data, and used for the output.
Missing columns across packages will be filled with n/a.

For merging two .janno files **A** and **B** the following rules apply regarding undefined, arbitrary additional columns:

- If $\bf A$ has an additional column which is not in $\bf B$ then empty cells in the rows imported from $\bf B$ are filled with $\bf n/a$.
- If **A** and **B** share additional columns with identical column name, then they are treated as semantically identical units and merged accordingly.
- In the resulting .janno file, all additional columns from both $\bf A$ and $\bf B$ are sorted alphabetically and appended after the normal, specified variables.

The following example illustrates the described behaviour:

428 A.janno

416

421

423

424

426

Poseidon_ID	${\bf Group_Name}$	${\rm Genetic_Sex}$	AdditionalColumn1	AdditionalColumn2
XXX011	POP1	M	A	D
XXX012	POP2	F	В	E
XXX013	POP1	M	C	F

429 B.janno

Poseidon_ID	${\tt Group_Name}$	${\rm Genetic_Sex}$	${\bf Additional Column 3}$	AdditionalColumn2
YYY022	POP5	F	G	J
YYY023	POP5	F	H	K
YYY024	POP5	M	I	L

$_{430}$ A.janno + B.janno

Poseidon_ID	Group_Name	Genetic_Sex	AdditionalColumn1	AdditionalColumn2	AdditionalColumn3
XXX011	POP1	M	A	D	n/a
XXX012	POP2	F	В	E	n/a
XXX013	POP1	M	\mathbf{C}	F	n/a
YYY022	POP5	\mathbf{F}	n/a	J	G

Poseidon_ID	Group_Name	Genetic_Sex	AdditionalColumn1	AdditionalColumn2	AdditionalColumn3
YYY023	POP5	F	n/a	K	Н
YYY024	POP5	M	n/a	L	I

2.3.3 Treatment of the .ssf file while merging

The Sequencing Source File (short .ssf file) is forged in exactly the same way as the janno file. SSF files that are present are included in the forge product in the way that the user expects, following selection of those entities which are listed in the poseidon_IDs columns of the SSF files. Columns that are only present in some packages, including those not defined by our [Schema] are also included in the forged product in the same way as described for Janno above.

37 2.3.4 Other options

Just as for init the output package of forge is created as a new directory -o. The title can also be explicitly defined with -n.

--minimal allows for the creation of a minimal output package without .bib and .janno. This is especially useful for data analysis pipelines, where only the genotype data is required. Even more basic output comes with --onlyGeno, which means that only the genotype data is returned without any Poseidon package.

forge has a an optional flag --intersect, that defines, if the genotype data from different packages should
be merged with an union or an intersect operation. The default (if this option is not set) is to output the
union of all SNPs, with genotypes defined as missing in samples from packages which do not have a SNP that is
present in another package. With this option set, on the other hand, the forged dataset will typically have fewer
SNPs, but less missingness.

--intersect also influences the automatic determination of the snpSet field in the POSEIDON.yml file for the resulting package. If the snpSet s of all input packages are identical, then the resulting package will just inherit this configuration. Otherwise forge applies the following pairwise merging logic:

Input snpSet A	Input snpSet B	intersect	Ouput snpSet
Other	*	*	Other
1240K	HumanOrigins	True	${\bf Human Origins}$
1240K	HumanOrigins	False	1240K

--selectSnps allows to provide forge with a SNP file in EIGENSTRAT (.snp) or PLINK (.bim) format to create a package with a specific selection. When this option is set, the output package will have exactly the SNPs listed in this file. Any SNP not listed in the file will be excluded. If --intersect is also set, only the SNPs overlapping between the SNP file and the forged packages are output.

Merging genotype data across different data sources and file formats is tricky. forge is more verbose about potential issues, if the --logMode flag is set to VerboseLog.

457 The --onlyGeno command specifies that only genotype data should be output, not an entire Poseidon package.

With --packagewise the within-package selection step in forge can be skipped. This will result in outputting all individuals in the relevant packages, and hence a superset of the requested individuals/groups. It may result in better performance in cases where one wants to forge entire packages.

Genoconvert command 2.4

```
genoconvert converts the genotype data in a Poseidon package to a different file format. The respective entries
   in the POSEIDON.yml file are changed accordingly.
463
   Click here for command line details
   Usage: trident genoconvert ((-d|--baseDir DIR) |
                                   ((-p|--genoOne ARG) | --inFormat ARG --genoFile ARG
466
                                     --snpFile ARG --indFile ARG) [--snpSet ARG])
467
                                --outFormat ARG [--onlyGeno]
                                 [-o|--outPackagePath ARG] [--removeOld]
469
                                 [--outPlinkPopName ARG]
470
      Convert the genotype data in a Poseidon package to a different file format
471
472
   Available options:
473
      -h,--help
                                Show this help text
474
      -d,--baseDir DIR
                                a base directory to search for Poseidon Packages
475
                                 (could be a Poseidon repository)
476
                                one of the input genotype data files. Expects .bed or
      -p,--genoOne ARG
477
                                 .bim or .fam for PLINK and .geno or .snp or .ind for
478
                                EIGENSTRAT. The other files must be in the same
479
                                directory and must have the same base name
480
                                the format of the input genotype data: EIGENSTRAT or
      --inFormat ARG
481
                                PLINK (only necessary for data input with --genoFile
482
                                + --snpFile + --indFile)
483
                                the input geno file path
      --genoFile ARG
      --snpFile ARG
                                the input snp file path

      --indFile ARG
                                the input ind file path
486
      --snpSet ARG
                                the snpSet of the package: 1240K, HumanOrigins or
                                Other. (only relevant for data input with
488
                                 -p|--genoOne or --genoFile + --snpFile + --indFile,
489
                                because the packages in a -d|--baseDir already have
                                this information in their respective POSEIDON.yml
491
                                files) Default: Other
492
                                the format of the output genotype data: EIGENSTRAT or
      --outFormat ARG
493
494
      --onlyGeno
                                 should only the resulting genotype data be returned?
495
                                This means the output will not be a Poseidon package
      -o, -- outPackagePath ARG
                                the output package directory path - this is optional:
497
                                 If no path is provided, then the output is written to
498
                                the directories where the input genotype data file
                                 (.bed/.geno) is stored
500
                                Remove the old genotype files when creating the new
      --remove01d
501
                                 ones
      --outPlinkPopName ARG
                                Where to write the population/group name into the FAM
503
                                file in Plink-format. Three options are possible:
504
```

```
asFamily (default) | asPhenotype | asBoth. See also
505
                                  --inPlinkPopName.
506
   With the default setting
   trident genoconvert -d ... -d ... --outFormat EIGENSTRAT|PLINK
508
   all packages in -d will be converted to the desired --outFormat (either EIGENSTRAT or PLINK), if the data
   is not already in this format. This includes updating the respective POSEIDON.yml files.
510
   The "old" data is not deleted, but kept around. That means conversion can result in a package with both PLINK
511
   and EIGENSTRAT data, but only one is linked in the POSEIDON.yml file, and that is what will be used by
   trident. To delete the old data in the conversion you can add the --removeOld flag.
513
   Instead of -d to change Poseidon packages, the -p (+ --snpSet) or --inFormat + --genoFile + --snpFile + --indFi
514
   allow to directly convert genotype data that is not wrapped in a Poseidon package and store it to a directory
   given in -o . See this example:
516
   trident genoconvert \
517
      -p 2018_Mittnik_Baltic/Mittnik_Baltic.bed \
518
      --outFormat EIGENSTRAT
519
      -o my_directory
520
   2.5
          Update command
521
    update automatically harmonizes POSEIDON.yml files of one or multiple packages if the packages were
522
   changed. This is not an automatic update from one Poseidon version to the next!
523
   Click here for command line details
524
   Usage: trident update (-d|--baseDir DIR) [--poseidonVersion ARG]
525
                            [--ignorePoseidonVersion] [--versionComponent ARG]
526
                            [--noChecksumUpdate] [--newContributors ARG]
527
                            [--logText ARG] [--force]
528
      Update POSEIDON.yml files automatically
529
530
   Available options:
531
      -h,--help
                                 Show this help text
532
      -d,--baseDir DIR
                                 a base directory to search for Poseidon Packages
533
                                  (could be a Poseidon repository)
534
                                 Poseidon version the packages should be updated to:
      --poseidonVersion ARG
535
                                 e.g. "2.5.3" (default: Nothing)
536
                                 Read packages even if their poseidonVersion is not
      --ignorePoseidonVersion
537
                                  compatible with the trident version. The assumption
538
                                  is, that the package is already structurally adjusted
539
                                 to the trident version and only the version number is
540
                                 lagging behind.
541
      --versionComponent ARG
                                 Part of the package version number in the
542
                                 POSEIDON.yml file that should be updated: Major,
543
                                 Minor or Patch (see https://semver.org)
                                  (default: Patch)
545
```

```
--noChecksumUpdate
                                Should update of checksums in the POSEIDON.yml file
546
                                be skipped
547
                                ignore SNP and GenoFile
      --ignoreGeno
548
      --newContributors ARG
                                Contributors to add to the POSEIDON.yml file in the
549
                                form "[Firstname Lastname] (Email address);..."
550
      --logText ARG
                                Log text for this version jump in the CHANGELOG file
551
                                (default: "not specified")
552
      --force
                                Normally the POSEIDON.yml files are only changed if
553
                                the poseidonVersion is adjusted or any of the
                                checksums change. With --force a package version
555
                                update can be triggered even if this is not the case.
556
```

557 It can be called with a lot of optional arguments

```
trident update -d ... -d ... \
--poseidonVersion "X.X.X" \
--versionComponent Major/Minor/Patch \
--noChecksumUpdate
--ignoreGeno
--newContributors "[Firstname Lastname] (Email address);..."
--logText "short description of the update"
--force
```

By default update will not edit a package's POSEIDON.yml file, even when arguments like --versionComponent,

--newContributors or --logText are explicitly set. This default exists to run the function on a large set of

packages where only few of them were edited and need an active update. A package will only be modified by

update if either

- any of the files with checksums (e.g. the genotype data) in it were modified,
- the --poseidonVersion argument differs from the poseidonVersion in the package's POSEIDON.yml file
- or the --force flag was set in update.

570

571

572

573

576

578

570

581

582

584

585

587

588

If any of these applies to a package in the search directory (--baseDir / -d), it will be updated. This includes the following steps:

- If --poseidonVersion is different from the poseidonVersion field in the package, then that will be updated.
- The packageVersion will be incremented. If --versionComponent is not set, then it falls back to Patch, so a change in the last position of the three digit version number. Minor increments the middle, and Major the first position (see semantic versioning).
- The lastModified field will be updated to the current day (based on your computer's system time).
- The contributors in --newContributors will be added to the contributor field if they're not there already.
- If any checksums changed, then they will be updated. If certain checksums are not set yet, then they will be added. The checksum update can be skipped with --noChecksumUpdate or partially skipped for the genotype data with --ignoreGeno.
- The CHANGELOG.md file will be updated with a new row for the new version and the text in --logText (default: "not specified"), which will be appended as the first line of the file. If no CHANGELOG.md file

exists, then it will be created and referenced in the POSEIDON.yml file.

sheavy_exclamation_mark: As update reads and rewrites POSEIDON.yml files, it may change their inner order, layout or even content (e.g. if they have fields which are not in the Poseidon package definition). Create a backup of the POSEIDON.yml file before running update if you are uncertain.

3 Inspection commands

$_{94}$ 3.1 List command

628

```
list lists packages, groups and individuals of the datasets you use, or of the packages available on the server.
   Click here for command line details
   Usage: trident list ((-d|--baseDir DIR) | --remote [--remoteURL ARG])
                       (--packages | --groups | --individuals
598
                         [-j|--jannoColumn JANNO_HEADER]) [--raw]
599
     List packages, groups or individuals from local or remote Poseidon
600
     repositories
601
602
   Available options:
603
     -h,--help
                              Show this help text
604
     -d,--baseDir DIR
                              a base directory to search for Poseidon Packages
605
                              (could be a Poseidon repository)
606
                              list packages from a remote server instead the local
     --remote
607
                              file system
608
     --remoteURL ARG
                              URL of the remote Poseidon server
609
                              (default: "https://c107-224.cloud.gwdg.de")
610
     --packages
                              list all packages
611
                              list all groups, ignoring any group names after the
     --groups
612
                              first as specified in the Janno-file
613
     --individuals
                              list individuals
614
     -j,--jannoColumn JANNO HEADER
615
                              list additional fields from the janno files, using
                              the Janno column heading name, such as Country, Site,
617
                              Date_C14_Uncal_BP, Endogenous, ...
618
                              output table as tsv without header. Useful for piping
619
     --raw
                              into grep or awk
620
     --ignoreGeno
                              ignore SNP and GenoFile
621
   To list packages from your local repositories, as seen above you can run
622
   trident list -d ... -d ... --packages
623
   This will yield a table like this
     625
                                             1
                                                          | Nr Individuals |
   1
                                                  Date
626
   627
```

| 2015 1000Genomes 1240K haploid pulldown | 2020-08-10 | 2535

533 so a nicely formatted table of all packages, their last update and the number of individuals in it.

To view packages on the remote server, instead of using directories to specify the locations of repositories on your system, you can use --remote to show packages on the remote server. For example

636 trident list --packages --remote

will result in a view of all published packages in our public online repository.

You can also list groups, as defined in the third column of EIGENSTRAT .ind files (or the first column of a PLINK .fam file), and individuals with --groups and --individuals instead of --packages.

The --individuals flag provides a way to immediately access information from the .janno files on the command line. This works with the -j/--jannoColumn option. For example adding --jannoColum Country --jannoColumn Date_C14_Uncal_BP to the commands above will add the Country and the Date_C14_Uncal_BP columns to the respective output tables.

Note that if you want a less fancy table, for example because you want to load this into Excel, or pipe into another command that cannot deal with the neat table layout, you can use the --raw option to output that table as a simple tab-delimited stream.

₆₄₇ 3.2 Summarise command

summarise prints some general summary statistics for a given poseidon dataset taken from the .janno files.

Click here for command line details

```
Usage: trident summarise (-d|--baseDir DIR) [--raw]

Get an overview over the content of one or multiple Poseidon packages

Available options:
```

554 -h,--help Show this help text

-d,--baseDir DIR a base directory to search for Poseidon Packages

(could be a Poseidon repository)

657 --raw output table as tsv without header. Useful for piping

into grep or awk

You can run it with

656

660 trident summarise -d ... -d ...

which will show you context information like – among others – the number of individuals in the dataset, their sex distribution, the mean age of the samples (for ancient data) or the mean coverage on the 1240K SNP array in a table. summarise depends on complete .janno files and will silently ignore missing information for some statistics.

You can use the --raw option to output the summary table in a simple, tab-delimited layout.

666 3.3 Survey command

- survey tries to indicate package completeness (mostly focused on .janno files) for poseidon datasets.
- 668 Click here for command line details
- Usage: trident survey (-d|--baseDir DIR) [--raw]
- Survey the degree of context information completeness for Poseidon packages
- 672 Available options:
- 673 -h,--help Show this help text
- -d,--baseDir DIR a base directory to search for Poseidon Packages
- (could be a Poseidon repository)
- 676 --raw output table as tsv without header. Useful for piping
- into grep or awk
- 678 Running

671

- 679 trident survey -d ... -d ...
- will yield a table with one row for each package. See trident survey -h for a legend which cell of this table
- 681 means what.
- Again you can use the --raw option to output the survey table in a tab-delimited format.

⁶⁸³ 3.4 Validate command

- validate checks poseidon datasets for structural correctness.
- 685 Click here for command line details
- 686 Usage: trident validate (-d|--baseDir DIR)
- 687 Check one or multiple Poseidon packages for structural correctness
- 689 Available options:
- 690 -h,--help Show this help text
- on -d,--baseDir DIR a base directory to search for Poseidon Packages
 - (could be a Poseidon repository)
- 693 $\,$ --ignoreGeno $\,$ ignore SNP and GenoFile
- --fullGeno test parsing of all SNPs (by default only the first
 - 5 100 SNPs are probed)
- 696 --noExitCode do not produce an explicit exit code
- 697 --ignoreDuplicates do not stop on duplicated individual names in the
- package collection
- You can run it with
- 700 trident validate -d ... -d ...
- $_{701}$ and it will either report a success (Validation passed) or failure with specific error messages to simplify
- 702 fixing the issues.
- validate tries to ensure that each package in the dataset adheres to the schema definition. Here is a list of
- 704 what is checked:

• Presence of the necessary files

706

709

- Full structural correctness of .bib and .janno file
- Superficial correctness of genotype data files by parsing the first 100 SNPs. A full check that parses all SNPs can be run with the --fullGeno option
 - Correspondence of BibTeX keys in .bib and .janno
 - Correspondence of individual and group IDs in .janno and genotype data files
- In fact much of this validation already runs as part of the general package reading pipeline invoked for many trident subcommands (e.g. forge). validate is meant to be more thorough, though, and will explicitly fail if even a single package is broken.
- Remember to run it with --logMode VerboseLog to get more information if the output is not sufficient to debug an issue.
