25	1	$\mathbf{T}$	The trident CLI			
26	Tri	ident	is a command line software tool structured in multiple subcommands. If you installed it properly years $\frac{1}{2}$	эu		
27	cai	n call	it on the command line by typing trident. This will show an overview of the general options and	all		
28	sul	bcom	mands, which are explained in detail below.			
29	Us	age:	trident [version] [logMode ARG] [errLength ARG]			
30			[inPlinkPopName ARG] (COMMAND   COMMAND)			
31	trident is a management and analysis tool for Poseidon packages. Report issues					
32		here	: https://github.com/poseidon-framework/poseidon-hs/issues			

```
Available options:
     -h,--help
                                 Show this help text
35
     --version
                                 Show version number
36
     --logMode ARG
                                 How information should be reported: NoLog, SimpleLog,
37
                                 DefaultLog, ServerLog or VerboseLog
38
                                 (default: DefaultLog)
39
     --errLength ARG
                                 After how many characters should a potential error
40
                                 message be truncated. "Inf" for no truncation.
41
                                 (default: CharCount 1500)
42
     --inPlinkPopName ARG
                                 Where to read the population/group name from the FAM
43
                                 file in Plink-format. Three options are possible:
44
                                 asFamily (default) | asPhenotype | asBoth.
45
   Package creation and manipulation commands:
47
     init
                                 Create a new Poseidon package from genotype data
48
     fetch
                                 Download data from a remote Poseidon repository
                                 Select packages, groups or individuals and create a
     forge
50
                                 new Poseidon package from them
51
                                 Convert the genotype data in a Poseidon package to a
     genoconvert
52
                                 different file format
53
                                 Update POSEIDON.yml files automatically
     update
54
   Inspection commands:
56
     list
                                 List packages, groups or individuals from local or
57
                                 remote Poseidon repositories
     summarise
                                 Get an overview over the content of one or multiple
59
                                 Poseidon packages
60
                                 Synonym for summarise
     summarize
61
                                 Survey the degree of context information completeness
     survey
62
                                 for Poseidon packages
63
                                 Check one or multiple Poseidon packages for
     validate
                                 structural correctness
   Trident allows to work directly with genotype data (see -p below), but its optimized for the interaction with
   Poseidon packages, which wrap and contextualize the data. Most trident subcommands therefore have a central
   parameter, called --baseDir or simply -d to specify one or more base directories to look for packages. For example,
68
   if all Poseidon packages live inside a repository at /path/to/poseidon/packages you would simply say trident
   <subcommand> -d /path/to/poseidon/dirs/ and trident would automatically search all subdirectories inside
   of the repository for valid Poseidon packages (as identified by valid POSEIDON.yml files).
71
   You can arrange a poseidon repository in a hierarchical way. For example:
   /path/to/poseidon/packages
73
```

/modern

/ancient

/2019\_poseidon\_package1

/2019\_poseidon\_package2

74

75

```
/...
78
             /...
79
        /Reference_Genomes
80
             /...
81
             /...
82
   You can use this structure to select only the level of packages you're interested in, even individual ones, and you
    can make use of the fact that -d can be given multiple times.
84
    Being able to specify one or multiple repositories is often not enough, as you may have your own data to
85
    co-analyse with the main repository. This is easy to do, as you simply need to provide your own genotype data as
    yet another Poseidon package to be added to your trident command. For example, let's say you have genotype
87
    data in EIGENSTRAT format (trident supports EIGENSTRAT and PLINK as formats.):
    ~/my_project/my_project.geno
    ~/my_project/my_project.snp
90
    ~/my_project/my_project.ind
91
    then you can make that to a skeleton Poseidon package with the init command. You can also do it manually by
    simply adding a POSEIDON.yml file, with for example the following content:
93
    poseidonVersion: 2.5.0
    title: My_awesome_project
    description: Unpublished genetic data from my awesome project
    contributor:
      - name: Stephan Schiffels
        email: schiffels@institute.org
99
    packageVersion: 0.1.0
100
    lastModified: 2020-10-07
101
   genotypeData:
102
      format: EIGENSTRAT
103
      genoFile: my_project.geno
104
      snpFile: my_project.snp
105
      indFile: my_project.ind
106
    jannoFile: my_project.janno
107
    bibFile: sources.bib
108
    Two remarks: 1) all file paths are considered relative to the directory in which POSEIDON.yml resides. Here we
    assume that you put this file into the same directory as the three genotype files. 2) Besides the genotype data
110
   files there are two (technically optional) files referenced by this example POSEIDON.yml file: sources.bib and
111
    my_project.janno. Of course you can add them manually - init automatically creates empty dummy versions.
112
    Once you have set up your own "Poseidon" package (which is really only a skeleton so far), you can add it to
113
   your trident analysis, by simply adding your project directory to the command using -d, for example:
114
    trident list -d /path/to/poseidon/packages/modern \
115
      -d /path/to/poseidon/packages/ReferenceGenomes
116
```

-d ~/my\_project --packages

137

#### 1.1.1 Logging and command line output

For all subcommands the general argument --logMode defines how trident reports messages (to stderr) on the command line:

- NoLog: Hides all messages.
  - SimpleLog: Plain and simple output to stderr.
  - DefaultLog: Adds severity indicators before each message. (default setting)
- ServerLog: Additionally adds timestamps before each message.
  - VerboseLog: Shows not just messages on the log levels Info, Warning and Error like the other modes, but also on the more verbose level Debug. Use this for debugging.

#### 128 1.1.2 Duplicates

- If multiple packages in a package repository share the same title, then trident will try to select the one with the highest version number. If this is not sufficient to resolve the conflict, trident will stop. An exception for that is the list subcommand, which will read and report all packages/groups/individuals in all versions.
- Individual/sample names (Poseidon\_IDs) within one package have to be unique, or trident will stop.
- We generally also discourage ID duplicates across packages in package repositories, but trident will generally continue with them after printing a warning. This does not apply for validate, by default (you can change this behaviour with --ignoreDuplicates), and forge. forge offers a special mechanism to resolve duplicates within its selection language (see below).

#### 1.1.3 Group names in .fam files

The .fam file of Plink-formatted genotype data is used inconsistently across different popular aDNA software tools to store group/population name information. The (global) option --inPlinkPopName with the arguments asFamily (default), asPhenotype and asBoth allows to control the reading of the population name from Plink .fam files. The subcommands that write genotype data (forge, genoconvert) have a corresponding option --outPlinkPopName to specify this for the output.

## 44 1.1.4 Whitespaces in the .janno file

While reading the .janno file trident trims all leading and trailing whitespaces around individual cells. Also all instances of the No-Break Space unicode character will be removed. This means these whitespaces will not be preserved when a package is forged.

# <sup>148</sup> 2 Package creation and manipulation commands

### $_{\scriptscriptstyle 49}$ 2.1 Init command

init creates a new, valid Poseidon package from genotype data files. It adds a valid POSEIDON.yml file, a dummy .janno file for context information and an empty .bib file for literature references.

<sup>152</sup> Click here for command line details

153 Usage: trident init ((-p|--genoOne ARG) | --inFormat ARG --genoFile ARG

```
--snpFile ARG --indFile ARG) [--snpSet ARG]
154
                          (-o|--outPackagePath ARG) [-n|--outPackageName ARG]
155
                          [--minimal]
156
      Create a new Poseidon package from genotype data
157
158
   Available options:
159
      -h,--help
                                 Show this help text
160
      -p,--genoOne ARG
                                 one of the input genotype data files. Expects .bed or
161
                                 .bim or .fam for PLINK and .geno or .snp or .ind for
162
                                 EIGENSTRAT. The other files must be in the same
163
                                 directory and must have the same base name
164
      --inFormat ARG
                                 the format of the input genotype data: EIGENSTRAT or
165
                                 PLINK (only necessary for data input with --genoFile
                                 + --snpFile + --indFile)
167
      --genoFile ARG
                                 the input geno file path
168
      --snpFile ARG
                                 the input snp file path
169
      --indFile ARG
                                 the input ind file path
170
      --snpSet ARG
                                 the snpSet of the package: 1240K, HumanOrigins or
171
                                 Other. (only relevant for data input with
172
                                 -p|--genoOne or --genoFile + --snpFile + --indFile,
173
                                 because the packages in a -d|--baseDir already have
174
                                 this information in their respective POSEIDON.yml
175
                                 files) Default: Other
176
      -o, -- outPackagePath ARG
                                 the output package directory path
177
                                 the output package name - this is optional: If no
      -n, -- outPackageName ARG
178
                                 name is provided, then the package name defaults to
179
                                 the basename of the (mandatory) --outPackagePath
180
                                 argument
181
      --minimal
                                 should only a minimal output package be created?
182
   The command
183
   trident init \
184
      --inFormat EIGENSTRAT/PLINK \
185
      --genoFile path/to/geno_file \
186
      --snpFile path/to/snp_file \
187
      --indFile path/to/ind_file \
188
      --snpSet 1240K|HumanOrigins|Other \
189
      -o path/to/new_package_name
190
   requires the format (--inFormat) of your input data (either EIGENSTRAT or PLINK), the paths to the respective
191
   files (--genoFile, --snpFile, --indFile), and optionally the "shape" of these files (--snpSet), so if they cover
   the 1240K, the HumanOrigins or an Other SNP set. A simpler interface added in trident 0.29.0 is available with
193
   -p (+ --snpSet).
194
```

 $\begin{array}{ccc} & \text{EIGENSTRAT} & \text{PLINK} \\ \hline \\ \text{genoFile} & .\text{geno} & .\text{bed} \end{array}$ 

	EIGENSTRAT	PLINK
snpFile	.snp	.bim
indFile	.ind	.fam

The output package of init is created as a new directory -o, which should not already exist, and gets the package title corresponding to the basename of -o. You can also set the title explicitly with -n. The --minimal flag causes init to create a minimal package with a very basic POSEIDON.yml and no .bib and .janno files.

#### 2.2 Fetch command

fetch allows to download Poseidon packages from a remote Poseidon server. Read more about this repository here.

Click here for command line details

```
Usage: trident fetch (-d|--baseDir DIR)

(--downloadAll |

(--fetchFile ARG | (-f|--fetchString ARG)))

[--remoteURL ARG]
```

Download data from a remote Poseidon repository

```
209 Available options:
```

201

206

```
-h,--help
                                Show this help text
210
      -d,--baseDir DIR
                                a base directory to search for Poseidon Packages
211
                                (could be a Poseidon repository)
212
      --downloadAll
                                download all packages the server is offering
213
      --fetchFile ARG
                                A file with a list of packages. Works just as -f, but
214
                                multiple values can also be separated by newline, not
215
                                just by comma. -f and --fetchFile can be combined.
216
                                List of packages to be downloaded from the remote
      -f,--fetchString ARG
217
                                server. Package names should be wrapped in asterisks:
218
                                *package_title*. You can combine multiple values with
219
                                comma, so for example: "*package_1*, *package_2*,
220
                                *package_3*". fetchString uses the same parser as
221
                                forgeString, but does not allow excludes. If groups
222
                                or individuals are specified, then packages which
223
                                include these groups or individuals are included in
224
                                the download.
225
      --remoteURL ARG
                                URL of the remote Poseidon server
226
                                (default: "https://server.poseidon-adna.org")
227
   It works with
228
   trident fetch -d ... -d ... \
229
      -f "*package_title_1*,*package_title_2*,*package_title_3*,group_name,<individual1>"
230
```

and the entities you want to download must be listed either in a simple string of comma-separated values, which can be passed via -f/--fetchString, or in a text file (--fetchFile). Entities are then combined from these sources.

Entities are specified using a special syntax (see also the documentation of forge below): Package titles are wrapped in asterisks: \*package\_title\*, group names are spelled as is, and individual names are wrapped in angular brackets, so <individual1>. Fetch will figure out which packages need to be downloaded to include all specified entities. --downloadAll, which can be given instead of -f and --fetchFile, causes fetch to download all packages from the server. The downloaded packages are added in the first (!) -d directory (which gets created if it doesn't exist), but downloads are only performed if the respective packages are not already present in the latest version in any of the -d dirs.

Note that trident fetch makes most sense in combination with trident list --remote: First one can inspect what is available on the server, then one can create a custom fetch command.

fetch also has the optional arguments --remote https:://..." to name an alternative poseidon server. The default points to the DAG server.

## 2.3 Forge command

forge creates new Poseidon packages by extracting and merging packages, populations and individuals from
 your Poseidon repositories.

<sup>248</sup> Click here for command line details

```
Usage: trident forge ((-d|--baseDir DIR) |

((-p|--genoOne ARG) | --inFormat ARG --genoFile ARG

--snpFile ARG --indFile ARG) [--snpSet ARG])

[--forgeFile ARG | (-f|--forgeString ARG)]

[--selectSnps ARG] [--intersect] [--outFormat ARG]

[--minimal] [--onlyGeno] (-o|--outPackagePath ARG)

[-n|--outPackageName ARG] [--packagewise]

[--outPlinkPopName ARG]
```

Select packages, groups or individuals and create a new Poseidon package from them

Available options:

257

258 259

```
-h,--help
                                Show this help text
261
      -d,--baseDir DIR
                                a base directory to search for Poseidon Packages
                                (could be a Poseidon repository)
263
      -p,--genoOne ARG
                                one of the input genotype data files. Expects .bed or
264
                                .bim or .fam for PLINK and .geno or .snp or .ind for
                                EIGENSTRAT. The other files must be in the same
266
                                directory and must have the same base name
267
      --inFormat ARG
                                the format of the input genotype data: EIGENSTRAT or
                                PLINK (only necessary for data input with --genoFile
269
                                + --snpFile + --indFile)
270
     --genoFile ARG
                                the input geno file path
271
      --snpFile ARG
                                the input snp file path
272
```

--indFile ARG the input ind file path 273 --snpSet ARG the snpSet of the package: 1240K, HumanOrigins or 274 Other. (only relevant for data input with 275 -p|--genoOne or --genoFile + --snpFile + --indFile, 276 because the packages in a -d|--baseDir already have 277 this information in their respective POSEIDON.yml 278 files) Default: Other 279 --forgeFile ARG A file with a list of packages, groups or individual 280 samples. Works just as -f, but multiple values can 281 also be separated by newline, not just by comma. 282 Empty lines are ignored and comments start with "#", 283 so everything after "#" is ignored in one line. 284 Multiple instances of -f and --forgeFile can be given. They will be evaluated according to their 286 input order on the command line. 287 -f,--forgeString ARG List of packages, groups or individual samples to be combined in the output package. Packages follow the 289 syntax \*package\_title\*, populations/groups are simply 290 group\_id and individuals <individual\_id>. You can combine multiple values with comma, so for example: 292 "\*package\_1\*, <individual\_1>, <individual\_2>, 293 group\_1". Duplicates are treated as one entry. Negative selection is possible by prepending "-" to 295 the entity you want to exclude (e.g. "\*package\_1\*, 296 -<individual\_1>, -group\_1"). forge will apply excludes and includes in order. If the first entity 298 is negative, then forge will assume you want to merge 299 all individuals in the packages found in the baseDirs 300 (except the ones explicitly excluded) before the 301 exclude entities are applied. An empty forgeString 302 (and no --forgeFile) will therefore merge all 303 available individuals. If there are individuals in 304 your input packages with equal individual id, but 305 different main group or source package, they can be specified with the special syntax 307 "<package:group:individual>". 308 --selectSnps ARG To extract specific SNPs during this forge operation, 309 provide a Snp file. Can be either Eigenstrat (file 310 ending must be '.snp') or Plink (file ending must be 311 '.bim'). When this option is set, the output package 312 will have exactly the SNPs listed in this file. Any 313 SNP not listed in the file will be excluded. If 314 option '--intersect' is also set, only the SNPs 315 overlapping between the SNP file and the forged

packages are output.

316

```
--intersect
                                Whether to output the intersection of the genotype
318
                                files to be forged. The default (if this option is
319
                                not set) is to output the union of all SNPs, with
320
                                genotypes defined as missing in those packages which
321
                                do not have a SNP that is present in another package.
322
                                With this option set, the forged dataset will
323
                                typically have fewer SNPs, but less missingness.
324
      --outFormat ARG
                                 the format of the output genotype data: EIGENSTRAT or
325
                                PLINK. Default: PLINK
326
      --minimal
                                 should only a minimal output package be created?
327
      --onlyGeno
                                 should only the resulting genotype data be returned?
328
                                This means the output will not be a Poseidon package
329
      -o, -- outPackagePath ARG
                                the output package directory path
330
      -n, -- outPackageName ARG
                                the output package name - this is optional: If no
331
                                name is provided, then the package name defaults to
332
                                the basename of the (mandatory) --outPackagePath
333
                                argument
334
      --packagewise
                                Skip the within-package selection step in forge. This
335
                                will result in outputting all individuals in the
                                relevant packages, and hence a superset of the
337
                                requested individuals/groups. It may result in better
338
                                performance in cases where one wants to forge entire
                                packages or almost entire packages. Details: Forge
340
                                 conceptually performs two types of selection: First,
341
                                 it identifies which packages in the supplied base
                                directories are relevant to the requested forge, i.e.
343
                                whether they are either explicitly listed using
344
                                 *PackageName*, or because they contain selected
345
                                 individuals or groups. Second, within each relevant
346
                                package, individuals which are not requested are
347
                                removed. This option skips only the second step, but
348
                                still performs the first.
349
      --outPlinkPopName ARG
                                Where to write the population/group name into the FAM
350
                                file in Plink-format. Three options are possible:
351
                                asFamily (default) | asPhenotype | asBoth. See also
352
                                 --inPlinkPopName.
353
   forge can be used with
    trident forge -d ... -d ... \
355
      -f "*package_name*, group_id, <individual_id>" \
356
      -o path/to/new_package_name
357
   where the entities (packages, groups/populations, individuals/samples) you want in the output package can be
358
   denoted either as a string on the command line (-f/--forgeString), or in an input text file (--forgeFile).
359
   See the section below for the syntax of this selection language. Do not forget to wrap the --forgeString query
   in quotes.
```

```
Including one or multiple Poseidon packages with -d is not the only way to include data for a forge operation.

It is also possible to consider unpackaged genotype data directly with -p (+ --snpSet) or --inFormat +
--genoFile + --snpFile + --indFile (+ --snpSet). This makes the following example possible, where we
merge data from one Poseidon package and two genotype datasets to get a new EIGENSTRAT dataset.
```

```
trident forge \
366
      -d 2017_GonzalesFortesCurrentBiology \
      -p 2018_VeeramahPNAS/2018_VeeramahPNAS.fam \
368
      --inFormat PLINK \
369
      --genoFile 2017_HaberAJHG/2017_HaberAJHG.bed \
      --snpFile 2017_HaberAJHG/2017_HaberAJHG.bim \
371
      --indFile 2017_HaberAJHG/2017_HaberAJHG.fam \
372
      -f "<STR241.SG>,<ERS1790729.SG>,Iberia_HG.SG" \
373
      -o testpackage \
374
      --outFormat EIGENSTRAT \
375
      --onlyGeno
376
```

#### 377 2.3.1 The forge selection language

383

385

386

388

389

391

392

The text in --forgeString and --forgeFile are parsed as a domain specific query language that describes precisely which entities should be compiled in the output package of a given forge operation. The language has multiple syntactic elements and a specific evaluation logic.

In general a --forgeString query consists of multiple entities, separated by ,. The main entities are Poseidon packages, groups/populations and individuals/samples:

- Each package title is surrounded by \*: \*package\*. That means if you want all individuals of the Poseidon
  package 2019\_Jeong\_InnerEurasia in the output package you would add \*2019\_Jeong\_InnerEurasia\*
  to the query.
- Groups/populations are not specially marked: group. So to get all individuals of the group Swiss\_Roman\_period, you would simply add Swiss\_Roman\_period.
- Individuals/samples are surrounded by < and >: <individual>. ALA026 therefore becomes <ALA026>. A second way to denote individuals is with the more verbose and specific syntax <package:group:individual>. Such defined individuals take precedence over differently defined ones (so: directly with <individual> or as a subset of \*package\* or group). This allows to resolve duplication issues precisely at least in cases where the duplicated individuals differ in source package or primary group.

In the --forgeFile each line is treated as a separate forgeString, empty lines are ignored and #s start comments.

So this is a valid forgeFile:

```
# Packages
*package1*, *package2*

# Groups and individuals from other packages beyond package1 and package2
group1, <individual1>, group2, <individual2>, <individual3>

# group2 has two outlier individuals that should be ignored
-<bad_individual1> # This one has very low coverage
-<bad_individual2> # This one is from a different time period
```

By prepending - to the bad individuals, we can exclude them from the forged package. forge figures out the final list of samples to include by executing all forge-entities in order. So an entity list

\*PackageA\*,-<Individual1>,GroupA may result in a different outcome than \*PackageA\*,GroupA,-<Individual1>,

depending on whether <Individual1> belongs to GroupA or not. If the forge entity list starts with a negative
entity, or if the entity list is empty, forge will implicitly assume you want to include all individuals in all
packages found in the baseDirs (except the ones explicitly excluded, of course).

410 An empty forgeString will therefore merge all available individuals.

#### 2.3.2 Treatment of the .janno file while merging

forge merges and subsets .janno files along with the genotype data. If a package lacks a .janno file, then a basic one will be created internally based on the information in the genotype data, and used for the output. Missing columns across packages will be filled with n/a.

For merging two .janno files **A** and **B** the following rules apply regarding undefined, arbitrary additional columns:

- If A has an additional column which is not in B then empty cells in the rows imported from B are filled with n/a.
- If **A** and **B** share additional columns with identical column name, then they are treated as semantically identical units and merged accordingly.
- In the resulting .janno file, all additional columns from both  $\bf A$  and  $\bf B$  are sorted alphabetically and appended after the normal, specified variables.

The following example illustrates the described behaviour:

#### 423 A.janno

411

416

417

418

419

420

421

Poseidon_ID	Group_Name	${\rm Genetic\_Sex}$	AdditionalColumn1	AdditionalColumn2
XXX011	POP1	M	A	D
XXX012	POP2	F	В	E
XXX013	POP1	M	C	F

#### 424 B.janno

${\bf Poseidon\_ID}$	${\tt Group\_Name}$	${\rm Genetic\_Sex}$	${\bf Additional Column 3}$	${\bf Additional Column 2}$
YYY022	POP5	F	G	J
YYY023	POP5	F	H	K
YYY024	POP5	M	I	L

# $_{425}$ A.janno + B.janno

Poseidon_ID	Group_Name	Genetic_Sex	AdditionalColumn1	AdditionalColumn2	AdditionalColumn3
XXX011	POP1	M	A	D	n/a
XXX012	POP2	$\mathbf{F}$	В	E	n/a
XXX013	POP1	M	$\mathbf{C}$	F	n/a
YYY022	POP5	F	n/a	J	G

Poseidon_ID	Group_Name	Genetic_Sex	AdditionalColumn1	AdditionalColumn2	AdditionalColumn3
YYY023	POP5	F	n/a	K	Н
YYY024	POP5	M	n/a	L	I

#### 2.3.3 Treatment of the .ssf file while merging

The Sequencing Source File (short .ssf file) is forged in exactly the same way as the janno file. SSF files that are present are included in the forge product in the way that the user expects, following selection of those entities which are listed in the poseidon\_IDs columns of the SSF files. Columns that are only present in some packages, including those not defined by our [Schema] are also included in the forged product in the same way as described for Janno above.

#### 2.3.4 Other options

Just as for init the output package of forge is created as a new directory -o. The title can also be explicitly defined with -n.

--minimal allows for the creation of a minimal output package without .bib and .janno. This is especially useful for data analysis pipelines, where only the genotype data is required. Even more basic output comes with --onlyGeno, which means that only the genotype data is returned without any Poseidon package.

forge has a an optional flag --intersect, that defines, if the genotype data from different packages should be merged with an **union** or an **intersect** operation. The default (if this option is not set) is to output the union of all SNPs, with genotypes defined as missing in samples from packages which do not have a SNP that is present in another package. With this option set, on the other hand, the forged dataset will typically have fewer SNPs, but less missingness.

--intersect also influences the automatic determination of the snpSet field in the POSEIDON.yml file for the resulting package. If the snpSets of all input packages are identical, then the resulting package will just inherit this configuration. Otherwise forge applies the following pairwise merging logic:

Input snpSet A	Input snpSet B	intersect	Ouput snpSet
Other	*	*	Other
1240K	HumanOrigins	True	${\bf Human Origins}$
1240K	HumanOrigins	False	$1240 \mathrm{K}$

--selectSnps allows to provide forge with a SNP file in EIGENSTRAT (.snp) or PLINK (.bim) format to create a package with a specific selection. When this option is set, the output package will have exactly the SNPs listed in this file. Any SNP not listed in the file will be excluded. If --intersect is also set, only the SNPs overlapping between the SNP file and the forged packages are output.

Merging genotype data across different data sources and file formats is tricky. forge is more verbose about potential issues, if the --logMode flag is set to VerboseLog.

452 The --onlyGeno command specifies that only genotype data should be output, not an entire Poseidon package.

With --packagewise the within-package selection step in forge can be skipped. This will result in outputting all individuals in the relevant packages, and hence a superset of the requested individuals/groups. It may result in better performance in cases where one wants to forge entire packages.

#### 56 2.4 Genoconvert command

457

in the POSEIDON.yml file are changed accordingly. 458 Click here for command line details 459 Usage: trident genoconvert ((-d|--baseDir DIR) | ((-p|--genoOne ARG) | --inFormat ARG --genoFile ARG 461 --snpFile ARG --indFile ARG) [--snpSet ARG]) 462 --outFormat ARG [--onlyGeno] [-o|--outPackagePath ARG] [--removeOld] [--outPlinkPopName ARG] 465 Convert the genotype data in a Poseidon package to a different file format 467 Available options: 468 -h,--help Show this help text -d,--baseDir DIR a base directory to search for Poseidon Packages 470 (could be a Poseidon repository) 471 one of the input genotype data files. Expects .bed or -p,--genoOne ARG 472 .bim or .fam for PLINK and .geno or .snp or .ind for 473 EIGENSTRAT. The other files must be in the same 474 directory and must have the same base name 475 the format of the input genotype data: EIGENSTRAT or --inFormat ARG 476 PLINK (only necessary for data input with --genoFile 477 + --snpFile + --indFile) 478 the input geno file path --genoFile ARG 479 --snpFile ARG the input snp file path 480 --indFile ARG the input ind file path 481 --snpSet ARG the snpSet of the package: 1240K, HumanOrigins or 482 Other. (only relevant for data input with 483 -p|--genoOne or --genoFile + --snpFile + --indFile, 181 because the packages in a -d|--baseDir already have this information in their respective POSEIDON.yml 486 files) Default: Other 487 the format of the output genotype data: EIGENSTRAT or --outFormat ARG 488 489 --onlyGeno should only the resulting genotype data be returned? 490 This means the output will not be a Poseidon package -o, -- outPackagePath ARG the output package directory path - this is optional: 492 If no path is provided, then the output is written to 493 the directories where the input genotype data file (.bed/.geno) is stored 495 Remove the old genotype files when creating the new --remove01d 496 ones --outPlinkPopName ARG Where to write the population/group name into the FAM 498 file in Plink-format. Three options are possible: 499

genoconvert converts the genotype data in a Poseidon package to a different file format. The respective entries

```
asFamily (default) | asPhenotype | asBoth. See also
500
                                  --inPlinkPopName.
501
   With the default setting
    trident genoconvert -d ... -d ... --outFormat EIGENSTRAT|PLINK
503
    all packages in -d will be converted to the desired --outFormat (either EIGENSTRAT or PLINK), if the data is
    not already in this format. This includes updating the respective POSEIDON.yml files.
505
   The "old" data is not deleted, but kept around. That means conversion can result in a package with both PLINK
506
    and EIGENSTRAT data, but only one is linked in the POSEIDON.yml file, and that is what will be used by
    trident. To delete the old data in the conversion you can add the --removeOld flag.
508
   Instead of -d to change Poseidon packages, the -p (+ --snpSet) or --inFormat + --genoFile + --snpFile
509
    + --indFile (+ --snpSet) allow to directly convert genotype data that is not wrapped in a Poseidon package
    and store it to a directory given in -o. See this example:
511
    trident genoconvert \
512
      -p 2018_Mittnik_Baltic/Mittnik_Baltic.bed \
513
      --outFormat EIGENSTRAT
514
      -o my_directory
515
   2.5
          Update command
   update automatically harmonizes POSEIDON.yml files of one or multiple packages if the packages were changed.
517
   This is not an automatic update from one Poseidon version to the next!
    Click here for command line details
519
    Usage: trident update (-d|--baseDir DIR) [--poseidonVersion ARG]
520
                            [--ignorePoseidonVersion] [--versionComponent ARG]
521
                            [--noChecksumUpdate] [--newContributors ARG]
522
                            [--logText ARG] [--force]
523
      Update POSEIDON.yml files automatically
524
525
    Available options:
526
      -h,--help
                                  Show this help text
527
      -d,--baseDir DIR
                                  a base directory to search for Poseidon Packages
528
                                  (could be a Poseidon repository)
529
                                  Poseidon version the packages should be updated to:
      --poseidonVersion ARG
530
                                  e.g. "2.5.3" (default: Nothing)
531
                                 Read packages even if their poseidonVersion is not
      --ignorePoseidonVersion
532
                                  compatible with the trident version. The assumption
                                  is, that the package is already structurally adjusted
534
                                  to the trident version and only the version number is
535
                                  lagging behind.
536
      --versionComponent ARG
                                 Part of the package version number in the
537
                                  POSEIDON.yml file that should be updated: Major,
538
                                  Minor or Patch (see https://semver.org)
                                  (default: Patch)
540
```

```
--noChecksumUpdate
                                Should update of checksums in the POSEIDON.yml file
541
                                be skipped
542
                                ignore SNP and GenoFile
      --ignoreGeno
543
      --newContributors ARG
                                Contributors to add to the POSEIDON.yml file in the
544
                                form "[Firstname Lastname] (Email address);..."
545
      --logText ARG
                                Log text for this version jump in the CHANGELOG file
546
                                (default: "not specified")
547
      --force
                                Normally the POSEIDON.yml files are only changed if
548
                                the poseidonVersion is adjusted or any of the
                                checksums change. With --force a package version
550
                                update can be triggered even if this is not the case.
551
```

552 It can be called with a lot of optional arguments

```
trident update -d ... \
--poseidonVersion "X.X.X" \
--versionComponent Major/Minor/Patch \
--noChecksumUpdate
--ignoreGeno
--newContributors "[Firstname Lastname](Email address);..."
--logText "short description of the update"
--force
```

By default update will not edit a package's POSEIDON.yml file, even when arguments like --versionComponent,
--newContributors or --logText are explicitly set. This default exists to run the function on a large set of
packages where only few of them were edited and need an active update. A package will only be modified by
update if either

- any of the files with checksums (e.g. the genotype data) in it were modified,
- the --poseidonVersion argument differs from the poseidonVersion in the package's POSEIDON.yml file
- or the --force flag was set in update.

565

566

568

571

573

574

576

577

579

580

581

582

583

If any of these applies to a package in the search directory (--baseDir/-d), it will be updated. This includes the following steps:

- If --poseidonVersion is different from the poseidonVersion field in the package, then that will be updated.
- The packageVersion will be incremented. If --versionComponent is not set, then it falls back to Patch, so a change in the last position of the three digit version number. Minor increments the middle, and Major the first position (see semantic versioning).
- The lastModified field will be updated to the current day (based on your computer's system time).
- The contributors in --newContributors will be added to the contributor field if they're not there already.
- If any checksums changed, then they will be updated. If certain checksums are not set yet, then they will be added. The checksum update can be skipped with --noChecksumUpdate or partially skipped for the genotype data with --ignoreGeno.
- The CHANGELOG.md file will be updated with a new row for the new version and the text in --logText (default: "not specified"), which will be appended as the first line of the file. If no CHANGELOG.md file exists, then it will be created and referenced in the POSEIDON.yml file.

see :heavy\_exclamation\_mark: As update reads and rewrites POSEIDON.yml files, it may change their inner order, layout or even content (e.g. if they have fields which are not in the Poseidon package definition). Create a backup of the POSEIDON.yml file before running update if you are uncertain.

# 3 Inspection commands

#### 588 3.1 List command

```
list lists packages, groups and individuals of the datasets you use, or of the packages available on the server.
589
    Click here for command line details
    Usage: trident list ((-d|--baseDir DIR) | --remote [--remoteURL ARG])
591
                          (--packages | --groups | --individuals
592
                            [-j|--jannoColumn JANNO_HEADER]) [--raw]
593
594
      List packages, groups or individuals from local or remote Poseidon
595
      repositories
597
    Available options:
598
      -h,--help
                                 Show this help text
      -d,--baseDir DIR
                                  a base directory to search for Poseidon Packages
600
                                  (could be a Poseidon repository)
601
                                  list packages from a remote server instead the local
      --remote
                                  file system
603
      --remoteURL ARG
                                  URL of the remote Poseidon server
604
                                  (default: "https://server.poseidon-adna.org")
      --packages
                                  list all packages
606
      --groups
                                  list all groups, ignoring any group names after the
607
                                  first as specified in the Janno-file
      --individuals
                                  list individuals
609
      -j,--jannoColumn JANNO_HEADER
610
                                  list additional fields from the janno files, using
611
                                  the Janno column heading name, such as Country, Site,
612
                                  Date_C14_Uncal_BP, Endogenous, ...
613
                                  output table as tsv without header. Useful for piping
      --raw
614
                                  into grep or awk
615
    To list packages from your local repositories, as seen above you can run
616
    trident list -d ... -d ... --packages
617
   This will yield a nicely formatted table of all packages, their last update and the number of individuals in it.
618
   To view packages on the remote server, instead of using directories to specify the locations of repositories on
   your system, you can use --remote to show packages on the remote server. For example
620
    trident list --packages --remote
```

will result in a view of all published packages in our public online repository.

- You can also list groups, as defined in the third column of EIGENSTRAT .ind files (or the first/last column of a PLINK .fam file), and individuals with --groups and --individuals instead of --packages.
- The --individuals flag provides a way to immediately access information from the .janno files on the command
- 626 line. This works with the -j/--jannoColumn option. For example adding -j Country -j Date\_C14\_Uncal\_BP
- $_{627}$  to the commands above will add the Country and the Date\_C14\_Uncal\_BP columns to the respective output
- 628 tables.

637

640

- Note that if you want a less fancy table, for example because you want to load this into Excel, or pipe into
- another command that cannot deal with the neat table layout, you can use the --raw option to output that
- table as a simple tab-delimited stream.

#### <sub>632</sub> 3.2 Summarise command

- 533 summarise prints some general summary statistics for a given poseidon dataset taken from the .janno files.
- 634 Click here for command line details
- Usage: trident summarise (-d|--baseDir DIR) [--raw]
- 636 Get an overview over the content of one or multiple Poseidon packages
- 638 Available options:
- 639 -h,--help Show this help text
  - -d,--baseDir DIR a base directory to search for Poseidon Packages
- (could be a Poseidon repository)
- 642 --raw output table as tsv without header. Useful for piping
- into grep or awk
- You can run it with
- 645 trident summarise -d ... -d ...
- which will show you context information like among others the number of individuals in the dataset, their
- sex distribution, the mean age of the samples (for ancient data) or the mean coverage on the 1240K SNP array
- in a table. summarise depends on complete .janno files and will silently ignore missing information for some
- 649 statistics.

656

658

You can use the --raw option to output the summary table in a simple, tab-delimited layout.

#### 651 3.3 Survey command

- survey tries to indicate package completeness (mostly focused on .janno files) for poseidon datasets.
- 653 Click here for command line details
- Usage: trident survey (-d|--baseDir DIR) [--raw]
- Survey the degree of context information completeness for Poseidon packages
- 657 Available options:
  - -h,--help Show this help text
- 659 -d,--baseDir DIR a base directory to search for Poseidon Packages
- (could be a Poseidon repository)

```
output table as tsv without header. Useful for piping into grep or awk
```

663 Running

664 trident survey -d ... -d ...

 $^{665}$  will yield a table with one row for each package. See trident survey -h for a legend which cell of this table

666 means what.

667 Again you can use the --raw option to output the survey table in a tab-delimited format.

#### 668 3.4 Validate command

validate checks poseidon datasets for structural correctness.

670 Click here for command line details

Usage: trident validate (-d|--baseDir DIR)

672 Check one or multiple Poseidon packages for structural correctness

674 Available options:

673

676

677

680

683

691

694

695

675 -h,--help Show this help text

-d,--baseDir DIR a base directory to search for Poseidon Packages

(could be a Poseidon repository)

678 --ignoreGeno ignore SNP and GenoFile

679 --fullGeno test parsing of all SNPs (by default only the first

100 SNPs are probed)

681 --noExitCode do not produce an explicit exit code

--ignoreDuplicates do not stop on duplicated individual names in the

package collection

You can run it with

685 trident validate -d ... -d ...

and it will either report a success (Validation passed) or failure with specific error messages to simplify fixing the issues.

validate tries to ensure that each package in the dataset adheres to the schema definition. Here is a list of what is checked:

- Presence of the necessary files
- Full structural correctness of .bib and .janno file
- Superficial correctness of genotype data files by parsing the first 100 SNPs. A full check that parses all SNPs can be run with the --fullGeno option
  - Correspondence of BibTeX keys in .bib and .janno
  - Correspondence of individual and group IDs in .janno and genotype data files

In fact much of this validation already runs as part of the general package reading pipeline invoked for many trident subcommands (e.g. forge). validate is meant to be more thorough, though, and will explicitly fail if even a single package is broken.

699	Remember to run it withlogMode VerboseLog to get more information if the output is not sufficient to debug
700	an issue.
