35
   Available options:
36
     -h,--help
                                 Show this help text
37
     --version
                                 Show version number
38
     --logMode MODE
                                 How information should be reported: NoLog, SimpleLog,
39
                                 DefaultLog, ServerLog or VerboseLog.
40
                                 (default: DefaultLog)
41
     --debug
                                 Short for --logMode VerboseLog.
42
     --errLength INT
                                 After how many characters should a potential error
43
                                 message be truncated. "Inf" for no truncation.
44
                                 (default: CharCount 1500)
45
     --inPlinkPopName MODE
                                 Where to read the population/group name from the FAM
46
                                 file in Plink-format. Three options are possible:
47
                                 asFamily (default) | asPhenotype | asBoth.
48
   Package creation and manipulation commands:
50
     init.
                                 Create a new Poseidon package from genotype data
51
     fetch
                                 Download data from a remote Poseidon repository
52
                                 Select packages, groups or individuals and create a
     forge
53
                                 new Poseidon package from them
54
                                 Convert the genotype data in a Poseidon package to a
     genoconvert
55
                                 different file format
56
     rectify
                                 Adjust POSEIDON.yml files automatically to package
57
                                 changes
59
   Inspection commands:
60
     list
                                 List packages, groups or individuals from local or
61
                                 remote Poseidon repositories
62
                                 Get an overview over the content of one or multiple
     summarise
63
                                 Poseidon packages
                                 Survey the degree of context information completeness
     survey
65
                                 for Poseidon packages
66
     validate
                                 Check Poseidon packages or package components for
67
                                 structural correctness
   Trident allows to work directly with genotype data (see -p below), but its optimized for the interaction with
69
   Poseidon packages, which wrap and contextualize the data. Most trident subcommands therefore have a central
   parameter, called --baseDir or simply -d to specify one or more base directories to look for packages. For example,
71
   if all Poseidon packages live inside a repository at /path/to/poseidon/packages you would simply say trident
72
   <subcommand> -d /path/to/poseidon/dirs/ and trident would automatically search all subdirectories inside
   of the repository for valid Poseidon packages (as identified by valid POSEIDON.yml files).
74
```

You can arrange a poseidon repository in a hierarchical way. For example:

6 /path/to/poseidon/packages

77 /modern

```
/2019_poseidon_package1
78
             /2019_poseidon_package2
79
        /ancient
80
             /...
81
             /...
82
        /Reference_Genomes
83
             /...
             /...
85
    You can use this structure to select only the level of packages you're interested in, even individual ones, and you
    can make use of the fact that -d can be given multiple times.
87
    Being able to specify one or multiple repositories is often not enough, as you may have your own data to
88
    co-analyse with the main repository. This is easy to do, as you simply need to provide your own genotype data as
    yet another Poseidon package to be added to your trident command. For example, let's say you have genotype
    data in EIGENSTRAT format (trident supports EIGENSTRAT and PLINK as formats.):
91
    ~/my_project/my_project.geno
    ~/my_project/my_project.snp
93
    ~/my_project/my_project.ind
    then you can make that to a skeleton Poseidon package with the init command. You can also do it manually by
    simply adding a POSEIDON.yml file, with for example the following content:
96
    poseidonVersion: 2.7.1
    title: My_awesome_project
    description: Unpublished genetic data from my awesome project
99
    contributor:
100
      - name: Stephan Schiffels
101
        email: schiffels@institute.org
102
    packageVersion: 0.1.0
103
    lastModified: 2020-10-07
104
    genotypeData:
105
      format: EIGENSTRAT
106
      genoFile: my_project.geno
107
      snpFile: my_project.snp
108
      indFile: my_project.ind
109
    jannoFile: my_project.janno
110
    bibFile: sources.bib
111
    Two remarks: 1) all file paths are considered relative to the directory in which POSEIDON.yml resides. For this
112
    example we assume that this file is added into the same directory as the three genotype files. 2) Besides the
113
    genotype data files there are two (technically optional) files referenced by this example POSEIDON.yml file:
114
    sources.bib and my_project.janno. Of course you can add them manually - init automatically creates empty
115
    dummy versions.
116
    Once you have set up your own Poseidon package (which is really only a skeleton so far), you can add it to your
117
    trident analysis, by simply adding your project directory to the command using -d, for example:
```

trident list -d /path/to/poseidon/packages/modern \

```
-d /path/to/poseidon/packages/ReferenceGenomes
```

-d ~/my_project --packages

1.1 General notes

142

1.1.1 Logging and command line output

For all subcommands the general argument --logMode defines how trident reports messages (to stderr) on the command line:

- NoLog: Hides all messages.
 - SimpleLog: Plain and simple output to stderr.
 - DefaultLog: Adds severity indicators before each message. (default setting)
 - ServerLog: Additionally adds timestamps before each message.
- VerboseLog: Shows not just messages on the log levels Info, Warning and Error like the other modes, but also on the more verbose level Debug. Use this for debugging.

--debug is short for --logMode VerboseLog to activate this important log level more easily.

133 1.1.2 Duplicates

- If multiple packages in a package repository share the same title, then trident will try to select the one with the highest version number. If this is not sufficient to resolve the conflict, trident will stop. An exception for that is the list subcommand, which will read and report all packages/groups/individuals in all versions.
- Individual/sample names (Poseidon_IDs) within one package have to be unique, or trident will stop.
- We generally also discourage ID duplicates across packages in package repositories, but trident will generally continue with them after printing a warning. This does not apply for validate, by default (you can change this behaviour with --ignoreDuplicates), and forge. forge offers a special mechanism to resolve duplicates within its selection language (see below).

1.1.3 Group names in .fam files

The .fam file of Plink-formatted genotype data is used inconsistently across different popular aDNA software tools to store group/population name information. The (global) option --inPlinkPopName with the arguments asFamily (default), asPhenotype and asBoth allows to control the reading of the population name from Plink .fam files. The subcommands that write genotype data (forge, genoconvert) have a corresponding option --outPlinkPopName to specify this for the output.

1.1.4 Whitespaces in the .janno file

While reading the .janno file trident trims all leading and trailing whitespaces around individual cells. Also all instances of the No-Break Space unicode character will be removed. This means these whitespaces will not be preserved when a package is forged.

Package creation and manipulation commands 2

Init command 2.1

```
init creates a new, valid Poseidon package from genotype data files. It adds a valid POSEIDON.yml file, a dummy
    janno file for context information and an empty .bib file for literature references.
156
   Click here for command line details
157
   Usage: trident init ((-p|--genoOne FILE) | --inFormat FORMAT --genoFile FILE
158
                           --snpFile FILE --indFile FILE) [--snpSet SET]
159
                          (-o|--outPackagePath DIR) [-n|--outPackageName STRING]
160
                          [--minimal]
161
162
      Create a new Poseidon package from genotype data
163
164
   Available options:
      -h,--help
                                 Show this help text
166
      -p,--genoOne FILE
                                 One of the input genotype data files. Expects .bed,
167
                                 .bim or .fam for PLINK and .geno, .snp or .ind for
                                 EIGENSTRAT. The other files must be in the same
169
                                 directory and must have the same base name.
170
      --inFormat FORMAT
                                 The format of the input genotype data: EIGENSTRAT or
171
                                 PLINK. Only necessary for data input with --genoFile
172
                                 + --snpFile + --indFile.
173
                                 Path to the input geno file.
      --genoFile FILE
174
      --snpFile FILE
                                 Path to the input snp file.
175
      --indFile FILE
                                 Path to the input ind file.
176
      --snpSet SET
                                 The snpSet of the package: 1240K, HumanOrigins or
                                 Other. Only relevant for data input with -p|--genoOne
178
                                 or --genoFile + --snpFile + --indFile, because the
179
                                 packages in a -d|--baseDir already have this
180
                                 information in their respective POSEIDON.yml files.
181
                                 (default: Other)
182
      -o,--outPackagePath DIR
                                 Path to the output package directory.
183
      -n, -- outPackageName STRING
184
                                 The output package name. This is optional: If no name
185
                                 is provided, then the package name defaults to the
186
                                 basename of the (mandatory) --outPackagePath
187
                                 argument. (default: Nothing)
188
      --minimal
                                 Should the output data be reduced to a necessary
189
                                 minimum and omit empty scaffolding?
190
   The command
191
   trident init \
192
      --inFormat EIGENSTRAT/PLINK \
193
      --genoFile path/to/geno_file \
194
```

```
--snpFile path/to/snp_file \
--indFile path/to/ind_file \
--snpSet 1240K|HumanOrigins|Other \
--o path/to/new_package_name
```

requires the format (--inFormat) of your input data (either EIGENSTRAT or PLINK), the paths to the respective files (--genoFile, --snpFile, --indFile), and optionally the "shape" of these files (--snpSet), so if they cover the 1240K, the HumanOrigins or an Other SNP set. A simpler interface is available with -p (+ --snpSet).

	EIGENSTRAT	PLINK
genoFile	.geno	.bed
${\rm snpFile}$.snp	$. \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\$
$\operatorname{indFile}$.ind	.fam

The output package of init is created as a new directory -o, which should not already exist, and gets the package title corresponding to the basename of -o. You can also set the title explicitly with -n. The --minimal flag causes init to create a minimal package with a very basic POSEIDON.yml and no .bib and .janno files.

2.2 Fetch command

208

213

214

fetch allows to download Poseidon packages from a remote Poseidon server via a Web API. Read more about the data available with it here.

Click here for command line details

Download data from a remote Poseidon repository

```
Available options:
216
                                Show this help text
      -h,--help
217
     -d,--baseDir DIR
                                A base directory to search for Poseidon packages.
218
      --downloadAll
                                Download all packages the server is offering.
219
      --fetchFile FILE
                                A file with a list of packages. Works just as -f, but
220
                                multiple values can also be separated by newline, not
221
                                just by comma. -f and --fetchFile can be combined.
222
     -f,--fetchString DSL
                                List of packages to be downloaded from the remote
223
                                server. Package names should be wrapped in asterisks:
224
                                *package_title*. You can combine multiple values with
225
                                comma, so for example: "*package_1*, *package_2*,
226
                                *package_3*". fetchString uses the same parser as
227
                                forgeString, but does not allow excludes. If groups
228
                                or individuals are specified, then packages which
229
                                include these groups or individuals are included in
230
```

```
the download.
231
                                   URL of the remote Poseidon server.
      --remoteURL URL
232
                                   (default: "https://server.poseidon-adna.org")
233
                                   The name of the Poseidon package archive that should
      --archive STRING
234
                                   be queried. If not given, then the query falls back
235
                                   to the default archive of the server selected with
236
                                   --remoteURL. See the archive documentation at
237
                                   https://www.poseidon-adna.org/#/archive_overview for
238
                                   a list of archives currently available from the
239
                                   official Poseidon Web API. (default: Nothing)
240
   It works with
241
    trident fetch -d ... -d ... \
      -f "*package_title_1*,*package_title_2*,*package_title_3*,group_name,<individual1>"
243
    and the entities you want to download must be listed either in a simple string of comma-separated values, which
244
    can be passed via -f/--fetchString, or in a text file (--fetchFile). Entities are then combined from these
245
246
    Entities are specified using a special syntax (see also the documentation of forge below): Package titles are
247
   wrapped in asterisks: *package_title*, group names are spelled as is, and individual names are wrapped in
248
    angular brackets, so <individual1>. Fetch will figure out which packages need to be downloaded to include all
249
    specified entities. --downloadAll, which can be given instead of -f and --fetchFile, causes fetch to download
250
   all packages from the server. The downloaded packages are added in the first (!) -d directory (which gets created
251
   if it doesn't exist), but downloads are only performed if the respective packages are not already present in the
252
   latest version in any of the -d dirs.
    Note that trident fetch makes most sense in combination with trident list --remote: First one can inspect
254
    what is available on the server, then one can create a custom fetch command.
255
    fetch also has the optional arguments --remote https:://..." to name an alternative Poseidon server and
    --archive to select a Poseidon archive on the server. Here is a list of the archives available on the official
257
```

259 2.3 Forge command

Poseidon server.

258

271

forge creates new Poseidon packages by extracting and merging packages, populations and individuals from
 your Poseidon repositories.

Click here for command line details

```

them 273 274 Available options: 275 -h,--help Show this help text 276 -d,--baseDir DIR A base directory to search for Poseidon packages. 277 -p,--genoOne FILE One of the input genotype data files. Expects .bed, 278 .bim or .fam for PLINK and .geno, .snp or .ind for 279 EIGENSTRAT. The other files must be in the same 280 directory and must have the same base name. 281 --inFormat FORMAT The format of the input genotype data: EIGENSTRAT or 282 PLINK. Only necessary for data input with --genoFile 283 + --snpFile + --indFile. --genoFile FILE Path to the input geno file. 285 --snpFile FILE Path to the input snp file. 286 --indFile FILE Path to the input ind file. 287 --snpSet SET The snpSet of the package: 1240K, HumanOrigins or 288 Other. Only relevant for data input with -p|--genoOne 289 or --genoFile + --snpFile + --indFile, because the packages in a -d|--baseDir already have this 291 information in their respective POSEIDON.yml files. 292 (default: Other) --forgeFile FILE A file with a list of packages, groups or individual 294 samples. Works just as -f, but multiple values can 295 also be separated by newline, not just by comma. Empty lines are ignored and comments start with "#", 297 so everything after "#" is ignored in one line. 298 Multiple instances of -f and --forgeFile can be 299 given. They will be evaluated according to their 300 input order on the command line. 301 -f,--forgeString DSL List of packages, groups or individual samples to be 302 combined in the output package. Packages follow the 303 syntax *package_title*, populations/groups are simply 304 group_id and individuals <individual_id>. You can 305 combine multiple values with comma, so for example: 306 "*package_1*, <individual_1>, <individual_2>, 307 group_1". Duplicates are treated as one entry. Negative selection is possible by prepending "-" to 309 the entity you want to exclude (e.g. "*package_1*, 310 -<individual_1>, -group_1"). forge will apply 311 excludes and includes in order. If the first entity 312 is negative, then forge will assume you want to merge 313 all individuals in the packages found in the baseDirs 314 (except the ones explicitly excluded) before the exclude entities are applied. An empty forgeString 316

Select packages, groups or individuals and create a new Poseidon package from

(and no --forgeFile) will therefore merge all 317 available individuals. If there are individuals in 318 your input packages with equal individual id, but 319 different main group or source package, they can be 320 specified with the special syntax 321 "<package:group:individual>". 322 --selectSnps FILE To extract specific SNPs during this forge operation, 323 provide a Snp file. Can be either Eigenstrat (file 324 ending must be '.snp') or Plink (file ending must be 325 '.bim'). When this option is set, the output package 326 will have exactly the SNPs listed in this file. Any 327 SNP not listed in the file will be excluded. If 328 option '--intersect' is also set, only the SNPs overlapping between the SNP file and the forged 330 packages are output. (default: Nothing) 331 --intersect Whether to output the intersection of the genotype 332 files to be forged. The default (if this option is 333 not set) is to output the union of all SNPs, with 334 genotypes defined as missing in those packages which do not have a SNP that is present in another package. 336 With this option set, the forged dataset will 337 typically have fewer SNPs, but less missingness. The format of the output genotype data: EIGENSTRAT or --outFormat FORMAT 339 PLINK. (default: PLINK) 340 Should the output data be reduced to a necessary --minimal 341 minimum and omit empty scaffolding? 342 --onlyGeno Should only the resulting genotype data be returned? 343 This means the output will not be a Poseidon package. 344 Path to the output package directory. -o,--outPackagePath DIR 345 -n, -- outPackageName STRING 346 The output package name. This is optional: If no name 347 is provided, then the package name defaults to the 348 basename of the (mandatory) --outPackagePath 349 argument. (default: Nothing) 350 Skip the within-package selection step in forge. This --packagewise 351 will result in outputting all individuals in the 352 relevant packages, and hence a superset of the 353 requested individuals/groups. It may result in better 354 performance in cases where one wants to forge entire 355 packages or almost entire packages. Details: Forge conceptually performs two types of selection: First, 357 it identifies which packages in the supplied base 358 directories are relevant to the requested forge, i.e. 359 whether they are either explicitly listed using *PackageName*, or because they contain selected 361

```
individuals or groups. Second, within each relevant
362
                                  package, individuals which are not requested are
363
                                  removed. This option skips only the second step, but
                                  still performs the first.
      --outPlinkPopName MODE
                                  Where to write the population/group name into the FAM
366
                                  file in Plink-format. Three options are possible:
367
                                  asFamily (default) | asPhenotype | asBoth. See also
368
                                  --inPlinkPopName.
369
   forge can be used with
370
    trident forge -d ... -d ... \
371
      -f "*package_name*, group_id, <individual_id>" \
372
      -o path/to/new_package_name
373
    where the entities (packages, groups/populations, individuals/samples) you want in the output package can be
374
    denoted either as a string on the command line (-f/--forgeString), or in an input text file (--forgeFile).
375
   See the section below for the syntax of this selection language. Do not forget to wrap the --forgeString query
376
377
   Including one or multiple Poseidon packages with -d is not the only way to include data for a forge operation.
378
    It is also possible to consider unpackaged genotype data directly with -p (+ --snpSet) or --inFormat +
379
    --genoFile + --snpFile + --indFile (+ --snpSet). This makes the following example possible, where we
380
    merge data from one Poseidon package and two genotype datasets to get a new EIGENSTRAT dataset.
381
    trident forge \
382
      -d 2017_GonzalesFortesCurrentBiology \
383
      -p 2018_VeeramahPNAS/2018_VeeramahPNAS.fam \
      --inFormat PLINK \setminus
385
      --genoFile 2017_HaberAJHG/2017_HaberAJHG.bed \
386
      --snpFile 2017 HaberAJHG/2017 HaberAJHG.bim \
387
      --indFile 2017_HaberAJHG/2017_HaberAJHG.fam \
388
      -f "<STR241.SG>,<ERS1790729.SG>,Iberia_HG.SG" \
389
      -o testpackage \
390
      --outFormat EIGENSTRAT \
391
      --onlyGeno
392
```

2.3.1 The forge selection language

399

400

The text in --forgeString and --forgeFile are parsed as a domain specific query language that describes precisely which entities should be compiled in the output package of a given forge operation. The language has multiple syntactic elements and a specific evaluation logic.

In general a --forgeString query consists of multiple entities, separated by ,. The main entities are Poseidon packages, groups/populations and individuals/samples:

Each package title is surrounded by *: *package*. That means if you want all individuals of the Poseidon
package 2019_Jeong_InnerEurasia in the output package you would add *2019_Jeong_InnerEurasia*
to the query.

- Groups/populations are not specially marked: group. So to get all individuals of the group Swiss_Roman_period, you would simply add Swiss_Roman_period.
- Individuals/samples are surrounded by < and >: <individual>. ALA026 therefore becomes <ALA026>. A second way to denote individuals is with the more verbose and specific syntax <package:group:individual>. Such defined individuals take precedence over differently defined ones (so: directly with <individual> or as a subset of *package* or group). This allows to resolve duplication issues precisely at least in cases where the duplicated individuals differ in source package or primary group.

In the --forgeFile each line is treated as a separate forgeString, empty lines are ignored and #s start comments.

So this is a valid forgeFile:

```
# Packages
# Package1*, *package2*
# Groups and individuals from other packages beyond package1 and package2
# group1, <individual1>, group2, <individual2>, <individual3>
# group2 has two outlier individuals that should be ignored
# coverage
# cove
```

By prepending - to the bad individuals, we can exclude them from the forged package. forge figures out the final list of samples to include by executing all forge-entities in order. So an entity list

PackageA,-<Individual1>,GroupA may result in a different outcome than *PackageA*,GroupA,-<Individual1>,

depending on whether <Individual1> belongs to GroupA or not. If the forge entity list starts with a negative

entity, or if the entity list is empty, forge will implicitly assume you want to include all individuals in all

packages found in the baseDirs (except the ones explicitly excluded, of course).

An empty forgeString will therefore merge all available individuals.

2.3.2 Treatment of the .janno file while merging

forge merges and subsets .janno files along with the genotype data. If a package lacks a .janno file, then a basic one will be created internally based on the information in the genotype data, and used for the output. Missing columns across packages will be filled with n/a.

For merging two .janno files A and B the following rules apply regarding undefined, arbitrary additional columns:

- If A has an additional column which is not in B then empty cells in the rows imported from B are filled with n/a.
 - If **A** and **B** share additional columns with identical column name, then they are treated as semantically identical units and merged accordingly.
 - In the resulting .janno file, all additional columns from both **A** and **B** are sorted alphabetically and appended after the normal, specified variables.

The following example illustrates the described behaviour:

439 A.janno

432

433

434

435

436

437

402

403

406

Poseidon_ID	Group_Name	Genetic_Sex	AdditionalColumn1	AdditionalColumn2
XXX011	POP1	M	A	D
XXX012	POP2	F	В	E
XXX013	POP1	\mathbf{M}	C	F

440 B.janno

Poseidon_ID	Group_Name	$Genetic_Sex$	AdditionalColumn3	AdditionalColumn2
YYY022	POP5	F	G	J
YYY023	POP5	F	H	K
YYY024	POP5	M	I	L

441 A.janno + B.janno

Poseidon_ID	Group_Name	e Genetic_Sex	AdditionalColumn1	AdditionalColumn2	AdditionalColumn3
XXX011	POP1	M	A	D	n/a
XXX012	POP2	F	В	\mathbf{E}	n/a
XXX013	POP1	M	\mathbf{C}	\mathbf{F}	n/a
YYY022	POP5	F	n/a	J	G
YYY023	POP5	F	n/a	K	H
YYY024	POP5	M	n/a	L	I

442 2.3.3 Treatment of the .ssf file while merging

The Sequencing Source File (short .ssf file) is forged in exactly the same way as the janno file. SSF files that are present are included in the forge product in the way that the user expects, following selection of those entities which are listed in the poseidon_IDs columns of the SSF files. Columns that are only present in some packages, including those not defined by our [Schema] are also included in the forged product in the same way as described for Janno above.

448 2.3.4 Treatment of the .bib file while merging

In the forge process all relevant samples for the output package are determined. This includes their .janno entries and therefore the information on the publication keys documented for them in the .janno Publication column. The output .bib file compiles only the relevant references for the samples in the output package. It includes the references exactly once and is sorted alphabetically (by key).

2.3.5 Other options

- Just as for init the output package of forge is created as a new directory -o. The title can also be explicitly defined with -n.
- --minimal allows for the creation of a minimal output package without .bib and .janno. This is especially useful for data analysis pipelines, where only the genotype data is required. Even more basic output comes with --onlyGeno, which means that only the genotype data is returned without any Poseidon package.

forge has a an optional flag --intersect, that defines, if the genotype data from different packages should be merged with an **union** or an **intersect** operation. The default (if this option is not set) is to output the union of all SNPs, with genotypes defined as missing in samples from packages which do not have a SNP that is present in another package. With this option set, on the other hand, the forged dataset will typically have fewer SNPs, but less missingness.

--intersect also influences the automatic determination of the snpSet field in the POSEIDON.yml file for the resulting package. If the snpSets of all input packages are identical, then the resulting package will just inherit this configuration. Otherwise forge applies the following pairwise merging logic:

Input snpSet A	Input snpSet B	intersect	Ouput snpSet
Other	*	*	Other
1240K	HumanOrigins	True	HumanOrigins
1240K	HumanOrigins	False	1240K

--selectSnps allows to provide forge with a SNP file in EIGENSTRAT (.snp) or PLINK (.bim) format to create a package with a specific selection. When this option is set, the output package will have exactly the SNPs listed in this file. Any SNP not listed in the file will be excluded. If --intersect is also set, only the SNPs overlapping between the SNP file and the forged packages are output.

- Merging genotype data across different data sources and file formats is tricky. forge is more verbose about potential issues, if the --logMode flag is set to VerboseLog.
- The --onlyGeno command specifies that only genotype data should be output, not an entire Poseidon package.
- With --packagewise the within-package selection step in forge can be skipped. This will result in outputting
 all individuals in the relevant packages, and hence a superset of the requested individuals/groups. It may result
 in better performance in cases where one wants to forge entire packages.

477 2.4 Genoconvert command

genoconvert converts the genotype data in a Poseidon package to a different file format. The respective entries in the POSEIDON.yml file are changed accordingly.

480 Click here for command line details

```
Usage: trident genoconvert ((-d|--baseDir DIR) |

((-p|--genoOne FILE) | --inFormat FORMAT

--genoFile FILE --snpFile FILE --indFile FILE)

[--snpSet SET]) --outFormat FORMAT [--onlyGeno]

[-o|--outPackagePath DIR] [--removeOld]

[--outPlinkPopName MODE]
```

Convert the genotype data in a Poseidon package to a different file format

```
490 Available options:
```

```
-h,--help Show this help text

-d,--baseDir DIR A base directory to search for Poseidon packages.

-p,--genoOne FILE One of the input genotype data files. Expects .bed,
```

```
.bim or .fam for PLINK and .geno, .snp or .ind for
                                 EIGENSTRAT. The other files must be in the same
495
                                 directory and must have the same base name.
496
      --inFormat FORMAT
                                 The format of the input genotype data: EIGENSTRAT or
497
                                 PLINK. Only necessary for data input with --genoFile
498
                                 + --snpFile + --indFile.
490
      --genoFile FILE
                                 Path to the input geno file.
500
      --snpFile FILE
                                 Path to the input snp file.
501
      --indFile FILE
                                 Path to the input ind file.
502
      --snpSet SET
                                 The snpSet of the package: 1240K, HumanOrigins or
503
                                 Other. Only relevant for data input with -p|--genoOne
504
                                 or --genoFile + --snpFile + --indFile, because the
505
                                 packages in a -d|--baseDir already have this
                                 information in their respective POSEIDON.yml files.
507
                                 (default: Other)
508
      --outFormat FORMAT
                                 the format of the output genotype data: EIGENSTRAT or
                                 PLINK.
510
      --onlyGeno
                                 Should only the resulting genotype data be returned?
511
                                 This means the output will not be a Poseidon package.
512
      -o, -- outPackagePath DIR
                                 Path to the output package directory. This is
513
                                 optional: If no path is provided, then the output is
514
                                 written to the directories where the input genotype
515
                                 data file (.bed/.geno) is stored. (default: Nothing)
516
      --removeOld
                                 Remove the old genotype files when creating the new
517
                                 ones.
518
      --outPlinkPopName MODE
                                 Where to write the population/group name into the FAM
519
                                 file in Plink-format. Three options are possible:
520
                                 asFamily (default) | asPhenotype | asBoth. See also
521
                                 --inPlinkPopName.
522
   With the default setting
523
   trident genoconvert -d ... -d ... --outFormat EIGENSTRAT|PLINK
   all packages in -d will be converted to the desired --outFormat (either EIGENSTRAT or PLINK), if the data is
525
   not already in this format. This includes updating the respective POSEIDON.yml files.
   The "old" data is not deleted, but kept around. That means conversion can result in a package with both PLINK
527
   and EIGENSTRAT data, but only one is linked in the POSEIDON.yml file, and that is what will be used by
528
   trident. To delete the old data in the conversion you can add the --removeOld flag.
529
   Instead of -d to change Poseidon packages, the -p (+ --snpSet) or --inFormat + --genoFile + --snpFile
530
   + --indFile (+ --snpSet) allow to directly convert genotype data that is not wrapped in a Poseidon package
531
   and store it to a directory given in -o. See this example:
532
   trident genoconvert \
533
      -p 2018_Mittnik_Baltic/Mittnik_Baltic.bed \
534
      --outFormat EIGENSTRAT
535
```

-o my_directory

2.5 Rectify command

538

539

577

578

```
Click here for command line details
540
   Usage: trident rectify (-d|--baseDir DIR) [--ignorePoseidonVersion]
                             [--poseidonVersion ?.?.?]
542
                             [--packageVersion VPART [--logText STRING]]
543
                             [--checksumAll | [--checksumGeno] [--checksumJanno]
                               [--checksumSSF] [--checksumBib]]
545
                             [--newContributors DSL]
546
      Adjust POSEIDON.yml files automatically to package changes
548
549
   Available options:
      -h,--help
                                 Show this help text
551
      -d,--baseDir DIR
                                 A base directory to search for Poseidon packages.
552
      --ignorePoseidonVersion
                                 Read packages even if their poseidonVersion is not
                                 compatible with trident.
554
      --poseidonVersion ?.?.?
                                 Poseidon version the packages should be updated to:
555
                                 e.g. "2.5.3".
556
      --packageVersion VPART
                                 Part of the package version number in the
557
                                 POSEIDON.yml file that should be updated: Major,
558
                                 Minor or Patch (see https://semver.org).
559
                                 Log text for this version in the CHANGELOG file.
      --logText STRING
560
      --checksumAll
                                 Update all checksums.
561
      --checksumGeno
                                 Update genotype data checksums.
562
      --checksumJanno
                                 Update .janno file checksum.
563
      --checksumSSF
                                 Update .ssf file checksum
564
      --checksumBib
                                 Update .bib file checksum.
565
      --newContributors DSL
                                 Contributors to add to the POSEIDON.yml file in the
566
                                 form "[Firstname Lastname] (Email address);...".
567
   It can be called with a lot of optional arguments:
    trident rectify -d ... -d ... \
569
      --poseidonVersion "X.X.X" \
570
      --packageVersion Major|Minor|Patch \
571
      --logText "short description of the update"
572
      --checksumAll
573
      --newContributors "[Firstname Lastname] (Email address);..."
   These arguments determine which fields of the POSEIDON.yml file should be modified.
575
```

rectify automatically harmonizes POSEIDON.yml files of one or multiple packages. This is not an automatic

update from one Poseidon version to the next, but rather a clean-up wizard after manual modifications.

- --poseidonVersion allows a simple change of the poseidonVersion field in the POSEIDON.yml file.
- --packageVersion increments the package version number in the first, the second or the third position. It can optionally be called with --logText, which appends an entry to the CHANGELOG file for the

respecitve package version update. --logText also creates a new CHANGELOG file if it does not exist yet.

- --checksumGeno, --checksumJanno, --checksumSSF and --checksumBib add or modify the respective checksum fields in the POSEIDON.yml file. --checksumAll is a wrapper to call all of them at once.
- --newContributors adds new contributors.

:warning: As rectify reads and rewrites POSEIDON.yml files, it may change their inner order, layout or even content (e.g. if they have fields which are not in the POSEIDON.yml definition). Create a backup of the POSEIDON.yml file before running rectify if you are uncertain if this might affect you negatively.

586

591

11st lists packages, groups and individuals of the datasets you use, or of the packages available on the server.

Usage: trident list ((-d|--baseDir DIR) | --remote [--remoteURL URL]

590 Click here for command line details

```
[--archive STRING])
592
                         (--packages | --groups | --individuals
593
                           [-j|--jannoColumn COLNAME]) [--raw]
595
     List packages, groups or individuals from local or remote Poseidon
596
     repositories
597
   Available options:
599
     -h,--help
                                Show this help text
600
      -d,--baseDir DIR
                                A base directory to search for Poseidon packages.
601
                                List packages from a remote server instead the local
      --remote
602
                                file system.
603
      --remoteURL URL
                                URL of the remote Poseidon server.
604
                                (default: "https://server.poseidon-adna.org")
605
                                The name of the Poseidon package archive that should
      --archive STRING
                                be queried. If not given, then the query falls back
607
                                to the default archive of the server selected with
608
                                --remoteURL. See the archive documentation at
                                https://www.poseidon-adna.org/#/archive overview for
610
                                a list of archives currently available from the
611
                                official Poseidon Web API. (default: Nothing)
612
      --packages
                                List all packages.
613
      --groups
                                List all groups, ignoring any group names after the
614
                                first as specified in the .janno-file.
615
      --individuals
                                List all individuals/samples.
616
      -j,--jannoColumn COLNAME List additional fields from the janno files, using
617
                                the .janno column heading name, such as "Country",
                                "Site", "Date_C14_Uncal_BP", etc..
619
```

```
--raw
                                   Return the output table as tab-separated values
620
                                   without header. This is useful for piping into grep
621
                                   or awk.
622
   To list packages from your local repositories, as seen above you can run
623
    trident list -d ... -d ... --packages
624
    This will yield a nicely formatted table of all packages, their version and the number of individuals in them.
625
    You can use --remote to show packages on the remote server. For example
626
    trident list --packages --remote --archive "community-archive"
627
    will result in a view of all packages available in one of the public online archives. Just as for fetch, the --archive
628
   flag allows to choose which public archive to query.
629
    Independent of whether you query a local or an online archive, you can not just list packages, but also groups,
630
    as defined in the third column of EIGENSTRAT .ind files (or the first/last column of a PLINK .fam file), and
631
   individuals with the flags --groups and --individuals (instead of --packages).
    The --individuals flag additionally provides a way to immediately access information from .janno files
633
    on the command line. This works with the -j/--jannoColumn option. For example adding -j Country -j
634
   Date_C14_Uncal_BP to the commands above will add the Country and the Date_C14_Uncal_BP columns to the
635
    respective output tables.
636
   Note that if you want a less fancy table, for example because you want to load this into Excel, or pipe into
637
    another command that cannot deal with the table layout, you can use the --raw option to output that table as
638
   a simple tab-delimited stream.
639
    3.2
          Summarise command
640
    summarise prints some general summary statistics for a given poseidon dataset taken from the .janno files.
641
    Click here for command line details
642
    Usage: trident summarise (-d|--baseDir DIR) [--raw]
643
644
      Get an overview over the content of one or multiple Poseidon packages
645
646
    Available options:
647
                                   Show this help text
      -h,--help
648
      -d,--baseDir DIR
                                   A base directory to search for Poseidon packages.
649
                                   Return the output table as tab-separated values
      --raw
650
                                   without header. This is useful for piping into grep
651
                                   or awk.
    You can run it with
653
```

which will show you context information like – among others – the number of individuals in the dataset, their sex distribution, the mean age of the samples (for ancient data) or the mean coverage on the 1240K SNP array in a table. summarise depends on complete .janno files and will silently ignore missing information.

trident summarise -d ... -d ...

You can use the --raw option to output the summary table in a simple, tab-delimited layout.

559 3.3 Survey command

- 660 survey tries to indicate package completeness (mostly focused on .janno files) for poseidon datasets.
- 661 Click here for command line details
- 662 Usage: trident survey (-d|--baseDir DIR) [--raw]

Survey the degree of context information completeness for Poseidon packages

666 Available options:

-h,--help Show this help text

-d,--baseDir DIR A base directory to search for Poseidon packages.
-raw Return the output table as tab-separated values

without header. This is useful for piping into grep

or awk.

672 Running

667

670

682

683

686

688

691

692

694

696

- 673 trident survey -d ... -d ...
- will yield a table with one row for each package. See trident survey -h for a legend which cell of this table
- 675 means what.
- Again you can use the --raw option to output the survey table in a tab-delimited format.

₆₇₇ 3.4 Validate command

- validate checks Poseidon packages and indivudual package components for structural correctness.
- 679 Click here for command line details

```
Usage: trident validate ((-d|--baseDir DIR) [--ignoreGeno] [--fullGeno]
```

[--ignoreDuplicates] [-c|--ignoreChecksums]

[--ignorePoseidonVersion] |

--pyml FILE | (-p|--genoOne FILE) | --inFormat FORMAT

--genoFile FILE --snpFile FILE --indFile FILE |

--janno FILE | --ssf FILE | --bib FILE) [--noExitCode]

Check Poseidon packages or package components for structural correctness

689 Available options:

-h,--help Show this help text

-d,--baseDir DIR A base directory to search for Poseidon packages.

--ignoreGeno Ignore snp and geno file.

--fullGeno Test parsing of all SNPs (by default only the first

100 SNPs are probed).

695 --ignoreDuplicates Do not stop on duplicated individual names in the

package collection.

```
-c,--ignoreChecksums
                                 Whether to ignore checksums. Useful for speedup in
697
                                 debugging.
698
      --ignorePoseidonVersion
                                Read packages even if their poseidonVersion is not
699
                                 compatible with trident.
700
      --pyml FILE
                                 Path to a POSEIDON.yml file.
701
      -p,--genoOne FILE
                                 One of the input genotype data files. Expects .bed,
702
                                 .bim or .fam for PLINK and .geno, .snp or .ind for
703
                                 EIGENSTRAT. The other files must be in the same
704
                                 directory and must have the same base name.
705
                                 The format of the input genotype data: EIGENSTRAT or
      --inFormat FORMAT
706
                                PLINK. Only necessary for data input with --genoFile
707
                                 + --snpFile + --indFile.
708
      --genoFile FILE
                                Path to the input geno file.
709
      --snpFile FILE
                                Path to the input snp file.
710
      --indFile FILE
                                Path to the input ind file.
711
      -- janno FILE
                                Path to a .janno file.
712
      --ssf FILE
                                 Path to a .ssf file.
713
      --bib FILE
                                Path to a .bib file.
714
      --noExitCode
                                Do not produce an explicit exit code.
715
   You can run it with
716
```

717 trident validate -d ... -d ...

726

727

729

730

731

732

733

to check packages and it will either report a success (Validation passed) or failure with specific error messages.

Instead of validating entire packages with -d you can also apply it to individual files and package components: --pyml (POSEIDON.yml), -p | --inFormat + --genoFile + --snpFile + --indFile (genotype
data), --janno (.janno file), --ssf (.ssf file) or --bib (.bib file). In this case validate attempts to read and
parse the respective files individually and reports any issues it encounters. Note that this considers the files in
isolation and does not include any cross-file consistency checks.

When applied to packages, validate tries to ensure that each package adheres to the schema definition. Here is a list of what is checked:

- Structural correctness of the POSEIDON.yml file.
- Presence of all files references in the POSEIDON.yml file.
- Full structural correctness of .janno, .ssf and .bib file.
- Superficial correctness of genotype data files by parsing the first 100 SNPs. A full check that parses all SNPs can be triggered with the --fullGeno option. --ignoreGeno, on the other hand, causes validate to ignore the genotype data entirely, which speeds up the validation significantly.
- Correspondence of BibTeX keys in .bib and .janno
- Correspondence of sample IDs in .janno and .ssf.
- Correspondence of sample and group IDs in .janno and genotype data files.

In fact much of this validation already runs as part of the general package reading pipeline invoked for other trident subcommands (e.g. forge). validate is meant to be more thorough/brittle, though, and will explicitly fail if even a single package is broken. For special cases more flexibility can be enabled with the options --ignoreDuplicates, --ignoreChecksums and --ignorePoseidonVersion.
