11		3.3.2 Other options	8			
12		3.4 Genoconvert command	9			
13		3.5 Update command	10			
14	4	Inspection commands	12			
15		4.1 List command	12			
16		4.2 Summarise command	13			
17		4.3 Survey command	14			
18		4.4 Validate command	14			
19	1	Poseidon package repositories				
20	Tri	ident generally requires Poseidon "packages" to work with (since version 0.28.0 it also supports dire	ect			
21	int	teraction with "unpackaged" genotype data – see -p below). Most trident subcommands therefore have	a			
22	cer	ntral parameter, calledbaseDir or simply -d to specify one or more base directories to look for packag	es			
23	Fo	or example, if all Poseidon packages live inside a repository at /path/to/poseidon/packages you wou	ıld			
24	simply say trident <subcommand> -d /path/to/poseidon/dirs/ and trident would automatically search</subcommand>					
25	all subdirectories inside of the repository for valid poseidon packages (as identified by valid POSEIDON.yml					
26	file	es).				
27	Yo	ou can arrange a poseidon repository in a hierarchical way. For example:				
28	/p	eath/to/poseidon/packages				
29		/modern				
30		/2019_poseidon_package1				
31		/2019_poseidon_package2				
32		/ancient				

```
/...
33
            /...
34
       /Reference_Genomes
35
            /...
            /...
37
       /Archaic_Humans
38
            /...
39
            /...
40
   You can use this structure to select only the level of packages you're interested in, and you can make use of the
   fact that -d can be given multiple times.
42
   Let's use the list command to list all packages in the modern and Reference_Genomes:
43
   trident list -d /path/to/poseidon/packages/modern \
     -d /path/to/poseidon/packages/ReferenceGenomes --packages
45
   \mathbf{2}
        Analysing your own dataset outside of the main repository
   Being able to specify one or multiple repositories is often not enough, as you may have your own data to
   co-analyse with the main repository. This is easy to do, as you simply need to provide your own genotype data
   as yet another poseidon package to be added to your trident list command. For example, let's say you have
49
   genotype data in EIGENSTRAT format (trident supports EIGENSTRAT and PLINK as formats.):
50
   ~/my_project/my_project.geno
   ~/my_project/my_project.snp
52
   ~/my_project/my_project.ind
53
   then you can make that to a skeleton Poseidon package with the init command. You can also do it manually
   by simply adding a POSEIDON.yml file, with for example the following content:
55
   poseidonVersion: 2.5.0
   title: My_awesome_project
57
   description: Unpublished genetic data from my awesome project
58
   contributor:
59
     - name: Stephan Schiffels
60
       email: schiffels@institute.org
61
   packageVersion: 0.1.0
   lastModified: 2020-10-07
63
   genotypeData:
64
     format: EIGENSTRAT
65
     genoFile: my_project.geno
     snpFile: my_project.snp
67
     indFile: my_project.ind
   jannoFile: my_project.janno
69
   bibFile: sources.bib
```

Two remarks: 1) all file paths are considered *relative* to the directory in which POSEIDON.yml resides. Here I assume that you put this file into the same directory as the three genotype files. 2) Besides the genotype data

```
files there are two (technically optional) files referenced by this example POSEIDON.yml file: sources.bib
   and my_project.janno. Of course you can add them manually - init automatically creates empty dummy
74
   versions.
75
   Once you have set up your own "Poseidon" package (which is really only a skeleton so far), you can add it to
   your trident analysis, by simply adding your project directory to the command using -d:
77
   trident list -d /path/to/poseidon/packages/modern \
     -d /path/to/poseidon/packages/ReferenceGenomes
     -d ~/my_project --packages
80
```

## Package creation and manipulation commands

#### Init command

107

108

109

110

--minimal

The command

trident init \

init creates a new, valid poseidon package from genotype data files. It adds a valid POSEIDON.yml file, a 83 dummy .janno file for context information and an empty .bib file for literature references.

Click here for command line details

```
Usage: trident init ((-p|--genoOne ARG) | (-r|--inFormat ARG)
86
                           (-g|--genoFile ARG) (-s|--snpFile ARG) (-i|--indFile ARG))
87
                         [--snpSet ARG] (-o|--outPackagePath ARG)
88
                         [-n|--outPackageName ARG] [--minimal]
89
     Create a new Poseidon package from genotype data
91
   Available options:
92
     -h,--help
                                Show this help text
93
     -p,--genoOne ARG
                                one of the input genotype data files. Expects .bed or
                                .bim or .fam for PLINK and .geno or .snp or .ind for
                                EIGENSTRAT. The other files must be in the same
                                directory and must have the same base name
97
                                the format of the input genotype data: EIGENSTRAT or
     -r,--inFormat ARG
98
                                PLINK
qq
                                the input geno file path
     -g,--genoFile ARG
100
     -s,--snpFile ARG
                                the input snp file path
101
     -i,--indFile ARG
                                the input ind file path
102
     --snpSet ARG
                                the snpSet of the new package: 1240K, HumanOrigins or
103
                                Other. Default: Other
104
     -o,--outPackagePath ARG
                                the output package directory path
105
     -n,--outPackageName ARG
                                the output package name - this is optional: If no
106
                                name is provided, then the package name defaults to
```

argument

the basename of the (mandatory) --outPackagePath

should only a minimal output package be created?

```
-r EIGENSTRAT/PLINK \
113
      -g path/to/geno_file \
114
      -s path/to/snp_file \
115
      -i path/to/ind_file \
116
      --snpSet 1240K|HumanOrigins|Other \
117
      -o path/to/new_package_name
118
    requires the format -r (--inFormat) of your input data (either EIGENSTRAT or PLINK), the paths to the
119
    respective files in -g (--genoFile), -s (--snpFile), and -i (--indFile), and optionally the "shape"
120
    of these files (--snpSet), so if they cover the 1240K, the HumanOrigins or an Other SNP set. A simpler
121
    interface added in trident 0.29.0 is available with -p (+ --snpSet).
122
```

	EIGENSTRAT	PLINK	
genoFile	.geno	.bed	
${\rm snpFile}$	$.\mathrm{snp}$	$. \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\$	
$\operatorname{indFile}$	.ind	.fam	

The output package of init is created as a new directory -o, which should not already exist, and gets the 123 package title corresponding to the basename of -o . You can also set the title explicitly with -n . The --minimal flag causes init to create a minimal package with a very basic POSEIDON.yml and no .bib and 125 .janno files. 126

#### 3.2 Fetch command

127

133

fetch allows to download poseidon packages from a remote poseidon server. 128

Click here for command line details 129

```
Usage: trident fetch (-d|--baseDir DIR) [-f|--fetchString ARG] [--fetchFile ARG]
130
                          [--remoteURL ARG] [-u|--upgrade] [--downloadAll]
131
132
```

Download data from a remote Poseidon repository

```
Available options:
134
     -h,--help
                                Show this help text
135
     -d,--baseDir DIR
                                a base directory to search for Poseidon Packages
136
                                (could be a Poseidon repository)
137
     -f,--fetchString ARG
                                List of packages to be downloaded from the remote
138
                                server. Package names should be wrapped in asterisks:
139
                                *package_title*. You can combine multiple values with
140
                                comma, so for example: "*package_1*, *package_2*,
141
                                *package_3*". fetchString uses the same parser as
                                forgeString, but does not allow excludes. If groups
143
                                or individuals are specified, then packages which
144
                                include these groups or individuals are included in
145
                                the download.
146
                                A file with a list of packages. Works just as -f, but
     --fetchFile ARG
147
                                multiple values can also be separated by newline, not
148
```

```
just by comma. -f and --fetchFile can be combined.
149
                                  URL of the remote Poseidon
      --remoteURL ARG
150
                                  server (default: "https://c107-224.cloud.gwdg.de")
151
      -u,--upgrade
                                  overwrite outdated local package versions
152
      --downloadAll
                                  download all packages the server is offering
153
   It works with
    trident fetch -d ... -d ... \
155
      -f "*package_title_1*,*package_title_2*,*package_title_3*,group_name,<Individual1>" \
156
      --fetchFile path/to/forgeFile
157
    and the entities you want to download must be listed either in a simple string with comma-separated values
158
   (-f/--fetchString) or in a text file (--fetchFile). Entities are specified using a special syntax: Package
159
    titles are wrapped in asterisks: package_title (see also the documentation of forge below), group names are
160
    spelled as is, and individual names are wrapped in angular brackets, liks <Individual1>. Fetch will figure
161
    out which packages need to be downloaded to include all specified entities. --downloadAll causes fetch to
162
    ignore -f and download all packages from the server. The downloaded packages are added in the first (!) -d
163
    directory, but downloads are only performed if the respective packages are not already present in an up-to-date
164
    version in any of the -d dirs.
165
   Note that trident fetch makes most sense in combination with trident list --remote: First one can
166
    inspect what is available on the server, then one can create a custom fetch command.
167
    fetch also has the optional arguments --remote https:://..." do name an alternative poseidon server.
   The default points to the DAG server.
169
```

### 3.3 Forge command

170

171

172

175

forge creates new poseidon packages by extracting and merging packages, populations and individuals from your poseidon repositories.

To overwrite outdated package versions with fetch, the -u / --upgrade flag has to be set. Note that many

Click here for command line details

```
Usage: trident forge [-d|--baseDir DIR]
176
177
                            ((-p|--genoOne ARG) | (-r|--inFormat ARG)
178
                               (-g|--genoFile ARG) (-s|--snpFile ARG)
                               (-i|--indFile ARG)) [--snpSet ARG]]
180
                          [--forgeFile ARG | (-f|--forgeString ARG)]
181
                          [--selectSnps ARG] [--intersect] [--outFormat ARG]
                          [--minimal] [--onlyGeno] (-o|--outPackagePath ARG)
183
                          [-n|--outPackageName ARG] [-w|--warnings] [--no-extract]
184
      Select packages, groups or individuals and create a new Poseidon package from
185
186
187
   Available options:
188
      -h,--help
                                Show this help text
189
```

file systems do not offer a way to recover overwritten files. So be careful with this switch.

190	-d,baseDir DIR	a base directory to search for Poseidon Packages
191	n monoOno ADC	(could be a Poseidon repository)
192	-p,genoOne ARG	one of the input genotype data files. Expects .bed or .bim or .fam for PLINK and .geno or .snp or .ind for
193		EIGENSTRAT. The other files must be in the same
194		directory and must have the same base name
195	-rinFormat APC	-
196 197	-r,inFormat ARG	the format of the input genotype data: EIGENSTRAT or PLINK
198	-g,genoFile ARG	the input geno file path
199	-s,snpFile ARG	the input snp file path
200	-i,indFile ARG	the input ind file path
201	snpSet ARG	the snpSet of the new package: 1240K, HumanOrigins or
202		Other. Default: Other
203	forgeFile ARG	A file with a list of packages, groups or individual
204		samples. Works just as -f, but multiple values can
205		also be separated by newline, not just by comma.
206		Empty lines are ignored and comments start with "#",
207		so everything after "#" is ignored in one line.
208	-f,forgeString ARG	List of packages, groups or individual samples to be
209		combined in the output package. Packages follow the
210		<pre>syntax *package_title*, populations/groups are simply</pre>
211		<pre>group_id and individuals <individual_id>. You can</individual_id></pre>
212		combine multiple values with comma, so for example:
213		"*package_1*, <individual_1>, <individual_2>,</individual_2></individual_1>
214		<pre>group_1". Duplicates are treated as one entry.</pre>
215		Negative selection is possible by prepending "-" to
216		the entity you want to exclude (e.g. "*package_1*,
217		<pre>-<individual_1>, -group_1"). forge will apply</individual_1></pre>
218		excludes and includes in order. If the first entity
219		is negative, then forge will assume you want to merge
220		all individuals in the packages found in the baseDirs
221		(except the ones explicitly excluded) before the
222		exclude entities are applied. An empty forgeString
223		will therefore merge all available individuals.
224	selectSnps ARG	To extract specific SNPs during this forge operation,
225		provide a Snp file. Can be either Eigenstrat (file
226		ending must be '.snp') or Plink (file ending must be
227		'.bim'). When this option is set, the output package
228		will have exactly the SNPs listed in this file. Any
229		SNP not listed in the file will be excluded. If
230		option 'intersect' is also set, only the SNPs
231		overlapping between the SNP file and the forged
232		packages are output.
233	intersect	Whether to output the intersection of the genotype
234		files to be forged. The default (if this option is

```
not set) is to output the union of all SNPs, with
235
                                 genotypes defined as missing in those packages which
236
                                 do not have a SNP that is present in another package.
237
                                 With this option set, the forged dataset will
238
                                 typically have fewer SNPs, but less missingness.
239
      --outFormat ARG
                                 the format of the output genotype data: EIGENSTRAT or
240
                                 PLINK. Default: PLINK
241
      --minimal
                                 should only a minimal output package be created?
242
      --onlyGeno
                                 should only the resulting genotype data be returned?
243
                                 This means the output will not be a Poseidon package
244
      -o, -- outPackagePath ARG
                                 the output package directory path
245
      -n, -- outPackageName ARG
                                 the output package name - this is optional: If no
246
                                 name is provided, then the package name defaults to
                                 the basename of the (mandatory) --outPackagePath
248
                                 argument
249
      -w,--warnings
                                 Show all warnings for merging genotype data
250
      --no-extract
                                 Skip the selection step in forge. This will result in
251
                                 outputting all individuals in the relevant packages,
252
                                 and hence a superset of the requested
253
                                 individuals/groups. It may result in better
254
255
                                 performance in cases where one wants to forge entire
                                 packages or almost entire packages. Note that this
                                 will also ignore any ordering in the output
257
                                 groups/individuals. With this option active,
258
                                 individuals from the relevant packages will just be
                                 written in the order that they appear in the original
260
                                 packages.
261
    forge can be used with
    trident forge -d ... -d ... \
263
      -f "*package_name*, group_id, <individual_id>" \
264
      --forgeFile path/to/forgeFile \
265
      -o path/to/new_package_name
266
   where the entities (packages, groups/populations, individuals/samples) you want in the output package can
   be denoted either as as simple string with comma-separated values (-f/--forgeString) or in a text file
268
   ( --forgeFile ).
269
   Including one or multiple Poseidon packages with -d is not the only way to include data for a forge operation.
   It is also possible to include unpackaged genotype data directly with -r + -g + -s + -i (+ --snpSet) or
271
    -p (+ --snpSet). This makes the following example possible, where we merge data from one Poseidon package
272
   and two genotype datasets.
273
   trident forge \
274
      -d 2017_GonzalesFortesCurrentBiology \
275
      -r PLINK \
276
      -g 2017 HaberAJHG/2017 HaberAJHG.bed \
277
```

```
-s 2017_HaberAJHG/2017_HaberAJHG.bim \
278
      -i 2017_HaberAJHG/2017_HaberAJHG.fam \
279
      -r PLINK \
280
      -g 2018_VeeramahPNAS/2018_VeeramahPNAS.bed \
281
      -i 2018_VeeramahPNAS/2018_VeeramahPNAS.fam \
282
      -s 2018_VeeramahPNAS/2018_VeeramahPNAS.bim \
283
      -f "<STR241.SG>,<ERS1790729.SG>,Iberia_HG.SG" \
      -o testpackage \
285
      --onlyGeno
286
```

### 3.3.1 The forge selection language

288 Entities in the --forgeString or the --forgeFile have to be marked in a certain way:

- Each package is surrounded by \*, so if you want all individuals of 2019\_Jeong\_InnerEurasia in the output package you would add \*2019\_Jeong\_InnerEurasia\* to the list.
- Groups/populations are not specially marked. So to get all individuals of the group Swiss\_Roman\_period ,
   you would simply add Swiss\_Roman\_period .
  - Individuals/samples are surrounded by < and >, so ALA026 becomes <ALA026>.
- 294 Do not forget to wrap the forgeString in quotes.
- You can either use -f / --forgeString or --forgeFile. In the file each line is treated as a separate forgeString, empty lines are ignored and # s start comments. So this is a valid forgeFile:

```
# Packages
package1*, *package2*
```

289

290

291

293

299

# Groups and individuals from other packages beyond package1 and package2
group1, <individual1>, group2, <individual2>, <individual3>

# group2 has two outlier individuals that should be ignored
-<bad\_individual1> # This one has very low coverage
-<bad\_individual2> # This one is from a different time period

By prepending - to the bad individuals, we can exclude them from the forged package. forge figures out the final list of samples to include by executing all forge-entities in order. So an entity list

\*PackageA\*,-<Individual1>,GroupA may result in a different outcome than \*PackageA\*,GroupA,-<Individual1>,

depending on whether <Individual1> belongs to GroupA or not. If the forge entity list starts with a negative entity, or if the entity list is empty, forge will implicitly assume you want to include all individuals in all packages found in the baseDirs (except the ones explicitly excluded, of course). An empty forgeString will therefore merge all available individuals.

#### 313 3.3.2 Other options

Just as for init the output package of forge is created as a new directory -o. The title can also be explicitly defined with -n.

--minimal allows for the creation of a minimal output package without .bib and .janno . This might be especially useful for data analysis pipelines, where only the genotype data is required. Even more basic output

comes with --onlyGeno, which means that only the genotype data is returned without any Poseidon package.

forge has a an optional flag --intersect, that defines, if the genotype data from different packages should
be merged with an union or an intersect operation. The default (if this option is not set) is to output the
union of all SNPs, with genotypes defined as missing in samples from packages which do not have a SNP that is
present in another package. With this option set, on the other hand, the forged dataset will typically have fewer
SNPs, but less missingness.

--intersect also influences the automatic determination of the snpSet field in the POSEIDON.yml file for the resulting package. If the snpSet s of all input packages are identical, then the resulting package will just inherit this configuration. Otherwise forge applies the following pairwise merging logic:

Input snpSet A	Input snpSet B	intersect	Ouput snpSet
Other	*	*	Other
1240K	HumanOrigins	True	${\bf Human Origins}$
1240K	HumanOrigins	False	$1240 \mathrm{K}$

--selectSnps allows to provide forge with a SNP file in EIGENSTRAT (.snp) or PLINK (.bim) format to create a package with a specific selection. When this option is set, the output package will have exactly the SNPs listed in this file. Any SNP not listed in the file will be excluded. If --intersect is also set, only the SNPs overlapping between the SNP file and the forged packages are output.

Merging genotype data across different data sources and file formats is tricky. forge is more verbose about potential issues, if the -w / --warnings flag is set.

#### 3.4 Genoconvert command

318

324

325

326

333

350

351

genoconvert converts the genotype data in a Poseidon package to a different file format. The respective entries in the POSEIDON.yml file are changed accordingly.

Click here for command line details

-p,--genoOne ARG

```
Usage: trident genoconvert [-d|--baseDir DIR]
337
338
                                   ((-p|--genoOne ARG) | (-r|--inFormat ARG)
339
                                     (-g|--genoFile ARG) (-s|--snpFile ARG)
340
                                     (-i|--indFile ARG)) [--snpSet ARG]]
341
                                 --outFormat ARG [--onlyGeno]
342
                                 [-o|--outPackagePath ARG] [--removeOld]
343
      Convert the genotype data in a Poseidon package to a different file format
344
345
   Available options:
346
      -h,--help
                                 Show this help text
347
      -d,--baseDir DIR
                                 a base directory to search for Poseidon Packages
348
                                 (could be a Poseidon repository)
349
```

one of the input genotype data files. Expects .bed or

.bim or .fam for PLINK and .geno or .snp or .ind for

EIGENSTRAT. The other files must be in the same

```
directory and must have the same base name
353
                                 the format of the input genotype data: EIGENSTRAT or
      -r,--inFormat ARG
354
                                 PI.TNK
355
      -g,--genoFile ARG
                                 the input geno file path
356
      -s,--snpFile ARG
                                 the input snp file path
357
      -i,--indFile ARG
                                 the input ind file path
358
      --snpSet ARG
                                 the snpSet of the new package: 1240K, HumanOrigins or
359
                                 Other. Default: Other
360
      --outFormat ARG
                                 the format of the output genotype data: EIGENSTRAT or
361
                                 PLINK.
362
      --onlyGeno
                                 should only the resulting genotype data be returned?
363
                                 This means the output will not be a Poseidon package
      -o,--outPackagePath ARG
                                 the output package directory path - this is optional:
                                 If no path is provided, then the output is written to
366
                                 the directories where the input genotype data file
367
                                  (.bed/.geno) is stored
      --removeOld
                                 Remove the old genotype files when creating the new
369
                                 ones
370
   With the default setting
371
   trident genoconvert -d ... -d ... --outFormat EIGENSTRAT|PLINK
372
   all packages in -d will be converted to the desired --outFormat (either EIGENSTRAT or PLINK), if the data
373
   is not already in this format. This includes updating the respective POSEIDON.yml files.
374
   The "old" data is not deleted, but kept around. That means conversion can result in a package with both PLINK
   and EIGENSTRAT data, but only one is linked in the POSEIDON.yml file, and that is what will be used by
376
   trident. To delete the old data in the conversion you can add the --removeOld flag.
377
   Instead of -d to change Poseidon packages, the combination -r + -g + -s + -i (+ --snpSet) or
378
    -p (+ --snpSet) allows to directly convert genotype data that is not wrapped in a Poseidon package and
379
   store it to a directory given in -o. See this example:
380
   trident genoconvert \
      -p 2018 Mittnik Baltic/Mittnik Baltic.bed \
382
      --outFormat EIGENSTRAT
383
      -o my_directory
   3.5
          Update command
385
    update automatically updates POSEIDON.yml files of one or multiple packages if the packages were changed.
386
   Click here for command line details
387
   Usage: trident update (-d|--baseDir DIR) [--poseidonVersion ARG]
388
                            [--ignorePoseidonVersion] [--versionComponent ARG]
                            [--noChecksumUpdate] [--newContributors ARG]
390
                            [--logText ARG] [--force]
391
      Update POSEIDON.yml files automatically
```

393

```
Available options:
                                 Show this help text
      -h,--help
395
      -d,--baseDir DIR
                                 a base directory to search for Poseidon Packages
396
                                 (could be a Poseidon repository)
      --poseidonVersion ARG
                                 Poseidon version the packages should be updated to:
398
                                 e.g. "2.5.3" (default: Nothing)
399
      --ignorePoseidonVersion
                                 Read packages even if their poseidonVersion is not
400
                                 compatible with the trident version. The assumption
401
                                 is, that the package is already structurally adjusted
                                 to the trident version and only the version number is
403
                                 lagging behind.
404
      --versionComponent ARG
                                 Part of the package version number in the
405
                                 POSEIDON.yml file that should be updated: Major,
                                 Minor or Patch (see
407
                                 https://semver.org) (default: Patch)
408
      --noChecksumUpdate
                                 Should update of checksums in the POSEIDON.yml file
                                 be skipped
410
      --ignoreGeno
                                 ignore SNP and GenoFile
411
      --newContributors ARG
                                 Contributors to add to the POSEIDON.yml file in the
412
                                 form "[Firstname Lastname](Email address);..."
413
      --logText ARG
                                 Log text for this version jump in the CHANGELOG
414
                                 file (default: "not specified")
415
                                 Normally the POSEIDON.yml files are only changed if
      --force
416
                                 the poseidonVersion is adjusted or any of the
417
                                 checksums change. With --force a package version
418
                                 update can be triggered even if this is not the case.
419
   It can be called with a lot of optional arguments
420
   trident update -d ... -d ... \
421
      --poseidonVersion "X.X.X" \
422
     --versionComponent Major/Minor/Patch \
423
     --noChecksumUpdate
424
     --ignoreGeno
425
     --newContributors "[Firstname Lastname] (Email address);..."
426
      --logText "short description of the update"
427
     --force
428
   By default update will not edit a package's POSEIDON.yml file, even when arguments like --versionComponent,
    --newContributors or --logText are explicitly set. This default exists to run the function on a large set of
430
   packages where only few of them were edited and need an active update. A package will only be modified by
431
    update if either
432
      • any of the files with checksums (e.g. the genotype data) in it were modified,
433
      • the --poseidonVersion argument differs from the poseidonVersion in the package's POSEIDON.yml
434
        file
435
      • or the --force flag was set in update.
```

436

If any of these applies to a package in the search directory ( --baseDir / -d ), it will be updated. This includes
the following steps:

- If --poseidonVersion is different from the poseidonVersion field in the package, then that will be updated.
- The packageVersion will be incremented. If --versionComponent is not set, then it falls back to Patch, so a change in the last position of the three digit version number. Minor increments the middle, and Major the first position (see semantic versioning).
- The lastModified field will be updated to the current day (based on your computer's system time).
- The contributors in --newContributors will be added to the contributor field if they're not there already.
- If any checksums changed, then they will be updated. If certain checksums are not set yet, then they will be added. The checksum update can be skipped with --noChecksumUpdate or partially skipped for the genotype data with --ignoreGeno.
- The CHANGELOG.md file will be updated with a new row for the new version and the text in --logText (default: "not specified"), which will be appended as the first line of the file. If no CHANGELOG.md file exists, then it will be created and referenced in the POSEIDON.yml file.

sheavy\_exclamation\_mark: As update reads and rewrites POSEIDON.yml files, it may change their inner order, layout or even content (e.g. if they have fields which are not in the Poseidon package definition). Create a backup of the POSEIDON.yml file before running update if you are uncertain.

## 4 Inspection commands

#### 4.1 List command

440

441

443

444

446

447

448

450

451

452

1ist lists packages, groups and individuals of the datasets you use, or of the packages available on the server.

459 Click here for command line details

```
(--packages | --groups | --individuals
461
                           [-j|--jannoColumn JANNO_HEADER]) [--raw]
462
     List packages, groups or individuals from local or remote Poseidon
463
     repositories
465
   Available options:
466
      -h,--help
                                Show this help text
      -d,--baseDir DIR
                                a base directory to search for Poseidon Packages
468
                                 (could be a Poseidon repository)
469
                                list packages from a remote server instead the local
      --remote
470
                                file system
471
      --remoteURL ARG
                                URL of the remote Poseidon
472
                                 server (default: "https://c107-224.cloud.gwdg.de")
473
      --packages
                                list all packages
474
                                list all groups, ignoring any group names after the
      --groups
475
                                first as specified in the Janno-file
476
      --individuals
                                list individuals
477
```

Usage: trident list ((-d|--baseDir DIR) | --remote [--remoteURL ARG])

```
-j,--jannoColumn JANNO_HEADER
478
                           list additional fields from the janno files, using
479
                           the Janno column heading name, such as Country, Site,
480
                           Date_C14_Uncal_BP, Endogenous, ...
                            output table as tsv without header. Useful for piping
     --raw
482
                            into grep or awk
     --ignoreGeno
                            ignore SNP and GenoFile
   To list packages from your local repositories, as seen above you can run
485
   trident list -d ... -d ... --packages
   This will yield a table like this
487
     Title
                                              Date
                                                     | Nr Individuals |
489
   490
   491
   492
   | 2018_BostonDatashare_modern_published
                                         | 2020-08-10 | 2772
493
                                         1 ...
   so a nicely formatted table of all packages, their last update and the number of individuals in it.
496
   To view packages on the remote server, instead of using directories to specify the locations of repositories on
   your system, you can use --remote to show packages on the remote server. For example
498
   trident list --packages --remote
   will result in a view of all published packages in our public online repository.
500
   You can also list groups, as defined in the third column of EIGENSTRAT .ind files (or the first column of a
501
   PLINK .fam file), and individuals:
   trident list -d ... -d ... --groups
503
   trident list -d ... -d ... --individuals
```

The --individuals flag also provides a way to immediately access information from the .janno files on the command line. This works with the -j/--jannoColumn option. For example adding --jannoColum Country --jannoColumn Date\_C14\_Uncal\_BP to the commands above will add the Country and the Date\_C14\_Uncal\_BP columns to the respective output tables.

Note that if you want a less fancy table, for example because you want to load this into Excel, or pipe into another command that cannot deal with the neat table layout, you can use the --raw option to output that table as a simple tab-delimited stream.

### 512 4.2 Summarise command

summarise prints some general summary statistics for a given poseidon dataset taken from the .janno files.

514 Click here for command line details

Usage: trident summarise (-d|--baseDir DIR) [--raw]

```
Get an overview over the content of one or multiple Poseidon packages
516
517
    Available options:
518
      -h,--help
                                  Show this help text
519
      -d,--baseDir DIR
                                  a base directory to search for Poseidon Packages
520
                                  (could be a Poseidon repository)
521
                                  output table as tsv without header. Useful for piping
      --raw
522
                                  into grep or awk
523
   You can run it with
    trident summarise -d ... -d ...
525
   which will show you context information like - among others - the number of individuals in the dataset, their
526
   sex distribution, the mean age of the samples (for ancient data) or the mean coverage on the 1240K SNP array
    in a table. summarise depends on complete janno files and will silently ignore missing information for some
528
   statistics.
529
    You can use the --raw option to output the summary table in a simple, tab-delimited layout.
530
          Survey command
    4.3
531
    survey tries to indicate package completeness (mostly focused on .janno files) for poseidon datasets.
    Click here for command line details
533
    Usage: trident survey (-d|--baseDir DIR) [--raw]
      Survey the degree of context information completeness for Poseidon packages
535
536
    Available options:
      -h,--help
                                  Show this help text
538
      -d,--baseDir DIR
                                  a base directory to search for Poseidon Packages
539
                                  (could be a Poseidon repository)
                                  output table as tsv without header. Useful for piping
      --raw
541
                                  into grep or awk
542
   Running
    trident survey -d ... -d ...
544
    will yield a table with one row for each package. See trident survey -h for a legend which cell of this table
    means what.
546
   Again you can use the --raw option to output the survey table in a tab-delimited format.
          Validate command
    4.4
    validate checks poseidon datasets for structural correctness.
```

549

Click here for command line details

Usage: trident validate (-d|--baseDir DIR) [--verbose] 551

Check one or multiple Poseidon packages for structural correctness 552

```
553

554 Available options:

555 -h,--help

556 -d,--baseDir DIR

557

558 --verbose

559 --ignoreGeno
```

Show this help text

a base directory to search for Poseidon Packages

(could be a Poseidon repository)

print more output to the command line

ignore SNP and GenoFile

560 --noExitCode do not produce an explicit exit code

You can run it with

567

568

570

571

```
562 trident validate -d ... -d ...
```

and it will either report a success (Validation passed) or failure with specific error messages to simplify fixing the issues.

validate tries to ensure that each package in the dataset adheres to the schema definition. Here is a list of what is checked:

- Presence of the necessary files
- Full structural correctness of .bib and .janno file
- Superficial correctness of genotype data files. A full check would be too computationally expensive
- Correspondence of BibTeX keys in .bib and .janno
- Correspondence of individual and group IDs in .janno and genotype data files

In fact much of this validation already runs as part of the general package reading pipeline invoked for many trident subcommands (e.g. forge). validate is meant to be more thorough, though, and will explicitly fail if even a single package is broken.
