2	0.1 Guide for trident v1.1	.7.0					
3	0.1.1 The trident CI	J					
4	0.1.2 Package creation and manipulation commands						
5	0.1.3 Inspection commands						
6	0.1 Guide for trident v1.1.7.0						
	0.1.1 The trident CLI						
		ware tool structured in multiple subcommands. If you installed it properly you					
		e by typing trident. This will show an overview of the general options and all					
.0	subcommands, which are expla	tined in detail below.					
.1	Usage: trident [version]	[logMode ARG] [errLength ARG] (COMMAND COMMAND)					
.2	trident is a management	and analysis tool for Poseidon packages. Report issues					
.3	here: https://github.com	n/poseidon-framework/poseidon-hs/issues					
.4							
.5	Available options:						
.6	-h,help	Show this help text					
.7	version	Show version number					
.8	logMode ARG	How information should be reported: NoLog, SimpleLog,					
9		DefaultLog, ServerLog or VerboseLog					
0		(default: DefaultLog)					
21	errLength ARG	After how many characters should a potential error					
2		message be truncated. "Inf" for no truncation.					
23		(default: CharCount 1500)					
24							
25	Package creation and manip						
26	init	Create a new Poseidon package from genotype data					
27	fetch	Download data from a remote Poseidon repository					
8	forge	Select packages, groups or individuals and create a					
9		new Poseidon package from them					
10	genoconvert	Convert the genotype data in a Poseidon package to a					
1	undata	different file format					
12	update	Update POSEIDON.yml files automatically					
13	Inspection commands:						
4	list	List packages, groups or individuals from local or					
5	1150	remote Poseidon repositories					
16 17	summarise	Get an overview over the content of one or multiple					
18	2 ammar 100	Poseidon packages					
19	summarize	Synonym for summarise					
10	survey	Survey the degree of context information completeness					
1		for Poseidon packages					
12	validate	Check one or multiple Poseidon packages for					
		<u>.</u>					

structural correctness

For all subcommands the general argument --logMode defines how trident reports messages (to stderr) on the command line:

• NoLog: Hides all messages.

43

46

47

49

50

51

- SimpleLog: Plain and simple output to stderr.
- DefaultLog: Adds severity indicators before each message. (default setting)
- ServerLog: Additionally adds timestamps before each message.
- VerboseLog: Shows not just messages on the log levels Info, Warning and Error like the other modes, but also on the more verbose level Debug. Use this for debugging.

52 **0.1.1.1** Handling data with trident Trident allows to work directly with genotype data (see -p below),
53 but its optimized for the interaction with Poseidon packages, which wrap and contextualize the data. Most
54 trident subcommands therefore have a central parameter, called --baseDir or simply -d to specify one or
55 more base directories to look for packages. For example, if all Poseidon packages live inside a repository at
56 /path/to/poseidon/packages you would simply say trident <subcommand> -d /path/to/poseidon/dirs/
57 and trident would automatically search all subdirectories inside of the repository for valid Poseidon packages
58 (as identified by valid POSEIDON.yml files).

You can arrange a poseidon repository in a hierarchical way. For example:

```
/path/to/poseidon/packages
60
        /modern
61
            /2019_poseidon_package1
62
            /2019_poseidon_package2
        /ancient
64
            /...
65
            /...
        /Reference Genomes
67
            /...
68
            /...
```

You can use this structure to select only the level of packages you're interested in, even individual ones, and you can make use of the fact that -d can be given multiple times.

Being able to specify one or multiple repositories is often not enough, as you may have your own data to co-analyse with the main repository. This is easy to do, as you simply need to provide your own genotype data as yet another Poseidon package to be added to your trident command. For example, let's say you have genotype data in EIGENSTRAT format (trident supports EIGENSTRAT and PLINK as formats.):

```
~/my_project/my_project.geno
~/my_project/my_project.snp
~/my_project/my_project.ind
```

then you can make that to a skeleton Poseidon package with the init command. You can also do it manually by simply adding a POSEIDON.yml file, with for example the following content:

```
poseidonVersion: 2.5.0
title: My_awesome_project
description: Unpublished genetic data from my awesome project
```

```
- name: Stephan Schiffels
85
        email: schiffels@institute.org
86
   packageVersion: 0.1.0
87
   lastModified: 2020-10-07
88
   genotypeData:
89
      format: EIGENSTRAT
      genoFile: my_project.geno
91
      snpFile: my_project.snp
92
      indFile: my_project.ind
   jannoFile: my_project.janno
   bibFile: sources.bib
   Two remarks: 1) all file paths are considered relative to the directory in which POSEIDON.yml resides. Here we
   assume that you put this file into the same directory as the three genotype files. 2) Besides the genotype data
97
   files there are two (technically optional) files referenced by this example POSEIDON.yml file: sources.bib and
   my_project.janno. Of course you can add them manually - init automatically creates empty dummy versions.
   Once you have set up your own "Poseidon" package (which is really only a skeleton so far), you can add it to
100
   your trident analysis, by simply adding your project directory to the command using -d, for example:
101
    trident list -d /path/to/poseidon/packages/modern \
102
```

0.1.1.2 Notes on duplicates

-d ~/my_project --packages

103

104

105

106

107

108

109

110

111

112

contributor:

- If multiple packages in a package repository share the same title, then trident will try to select the one with the highest version number. If this is not sufficient to resolve the conflict, trident will stop.
- Individual/sample names (Poseidon_IDs) within one package have to be unique, or trident will stop.
- We generally also discourage ID duplicates across packages in package repositories, but trident will generally continue with them after printing a warning. This does not apply for validate, by default (you can change this behaviour with --ignoreDuplicates), and forge forge offers a special mechanism to resolve duplicates within its selection language (see below).

9 0.1.2 Package creation and manipulation commands

-d /path/to/poseidon/packages/ReferenceGenomes

0.1.2.1 Init command init creates a new, valid Poseidon package from genotype data files. It adds a valid
 POSEIDON.yml file, a dummy .janno file for context information and an empty .bib file for literature references.

116 Click here for command line details

```
Usage: trident init ((-p|--genoOne ARG) | --inFormat ARG --genoFile ARG

--snpFile ARG --indFile ARG) [--snpSet ARG]

(-o|--outPackagePath ARG) [-n|--outPackageName ARG]

[--minimal]

Create a new Poseidon package from genotype data

Available options:
-h,--help Show this help text
```

```
one of the input genotype data files. Expects .bed or
      -p,--genoOne ARG
125
                                 .bim or .fam for PLINK and .geno or .snp or .ind for
126
                                 EIGENSTRAT. The other files must be in the same
127
                                 directory and must have the same base name
128
      --inFormat ARG
                                 the format of the input genotype data: EIGENSTRAT or
129
                                 PLINK (only necessary for data input with --genoFile
130
                                 + --snpFile + --indFile)
131
      --genoFile ARG
                                 the input geno file path
132
      --snpFile ARG
                                 the input snp file path
133
      --indFile ARG
                                 the input ind file path
134
      --snpSet ARG
                                 the snpSet of the package: 1240K, HumanOrigins or
135
                                 Other. (only relevant for data input with
136
                                 -p|--genoOne or --genoFile + --snpFile + --indFile,
                                 because the packages in a -d|--baseDir already have
138
                                 this information in their respective POSEIDON.yml
139
                                 files) Default: Other
140
      -o, -- outPackagePath ARG
                                 the output package directory path
141
      -n, -- outPackageName ARG
                                 the output package name - this is optional: If no
142
                                 name is provided, then the package name defaults to
                                 the basename of the (mandatory) --outPackagePath
144
                                 argument
145
      --minimal
                                 should only a minimal output package be created?
   The command
147
   trident init \
      --inFormat EIGENSTRAT/PLINK \
149
      --genoFile path/to/geno_file \
150
      --snpFile path/to/snp_file \
151
      --indFile path/to/ind_file \
152
      --snpSet 1240K|HumanOrigins|Other \
153
      -o path/to/new_package_name
154
   requires the format (--inFormat) of your input data (either EIGENSTRAT or PLINK), the paths to the respective
155
   files (--genoFile, --snpFile, --indFile), and optionally the "shape" of these files (--snpSet), so if they cover
156
   the 1240K, the HumanOrigins or an Other SNP set. A simpler interface added in trident 0.29.0 is available with
```

	EIGENSTRAT	PLINK
genoFile	.geno	.bed
${\rm snpFile}$.snp	$. \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\ \\$
$\operatorname{indFile}$.ind	.fam

-p (+ --snpSet).

158

The output package of init is created as a new directory -o, which should not already exist, and gets the package title corresponding to the basename of -o. You can also set the title explicitly with -n. The --minimal flag causes init to create a minimal package with a very basic POSEIDON.yml and no .bib and .janno files.

0.1.2.2 Fetch command fetch allows to download Poseidon packages from a remote Poseidon server. Read more about this repository here. 163 Click here for command line details Usage: trident fetch (-d|--baseDir DIR) 165 (--downloadAll | 166 (--fetchFile ARG | (-f|--fetchString ARG))) 167 [--remoteURL ARG] [-u|--upgrade] 168 Download data from a remote Poseidon repository 169 170 Available options: 171 -h,--help Show this help text 172 -d,--baseDir DIR a base directory to search for Poseidon Packages 173 (could be a Poseidon repository) 174 --downloadAll download all packages the server is offering 175 --fetchFile ARG A file with a list of packages. Works just as -f, but 176 multiple values can also be separated by newline, not 177 just by comma. -f and --fetchFile can be combined. 178 -f,--fetchString ARG List of packages to be downloaded from the remote 179 server. Package names should be wrapped in asterisks: 180 *package_title*. You can combine multiple values with 181 comma, so for example: "*package_1*, *package_2*, *package_3*". fetchString uses the same parser as 183 forgeString, but does not allow excludes. If groups 184 or individuals are specified, then packages which include these groups or individuals are included in 186 the download. 187 URL of the remote Poseidon server --remoteURL ARG 188 (default: "https://c107-224.cloud.gwdg.de") 189 overwrite outdated local package versions -u,--upgrade 190 It works with 191 trident fetch -d ... -d ... \ 192 -f "*package_title_1*,*package_title_2*,*package_title_3*,group_name,<Individual1>" 193 and the entities you want to download must be listed either in a simple string of comma-separated values, which 194 can be passed via -f/--fetchString, or in a text file (--fetchFile). Entities are then combined from these 195 sources. Entities are specified using a special syntax (see also the documentation of forge below): Package titles are 197 wrapped in asterisks: package_title, group names are spelled as is, and individual names are wrapped in angular 198 brackets, liks <Individual1>. Fetch will figure out which packages need to be downloaded to include all specified entities. --downloadAll, which can be given instead of -f and --fetchFile, causes fetch to download all 200 packages from the server. The downloaded packages are added in the first (!) -d directory (which gets created 201 if it doesn't exist), but downloads are only performed if the respective packages are not already present in an up-to-date version in any of the -d dirs. 203

Note that trident fetch makes most sense in combination with trident list --remote: First one can inspect

```
what is available on the server, then one can create a custom fetch command.
```

fetch also has the optional arguments --remote https:://..." to name an alternative poseidon server. The 206 default points to the DAG server.

To overwrite outdated package versions with fetch, the -u/--upgrade flag has to be set. Note that many file 208 systems do not offer a way to recover overwritten files. So be careful with this switch. 209

0.1.2.3 Forge command forge creates new Poseidon packages by extracting and merging packages, populations and individuals from your Poseidon repositories. 211

Click here for command line details 212

213

```
Usage: trident forge ((-d|--baseDir DIR) |
                            ((-p|--genoOne ARG) | --inFormat ARG --genoFile ARG
214
                              --snpFile ARG --indFile ARG) [--snpSet ARG])
215
                          [--forgeFile ARG | (-f|--forgeString ARG)]
216
                          [--selectSnps ARG] [--intersect] [--outFormat ARG]
217
                          [--minimal] [--onlyGeno] (-o|--outPackagePath ARG)
218
                          [-n|--outPackageName ARG] [--no-extract]
219
     Select packages, groups or individuals and create a new Poseidon package from
220
      them
221
222
   Available options:

                                Show this help text
224
      -d,--baseDir DIR
                                a base directory to search for Poseidon Packages
225
                                (could be a Poseidon repository)
226
      -p,--genoOne ARG
                                one of the input genotype data files. Expects .bed or
227
                                .bim or .fam for PLINK and .geno or .snp or .ind for
                                EIGENSTRAT. The other files must be in the same
229
                                directory and must have the same base name
230
                                the format of the input genotype data: EIGENSTRAT or
      --inFormat ARG
231
                                PLINK (only necessary for data input with --genoFile
232
                                + --snpFile + --indFile)
233
     --genoFile ARG
                                the input geno file path
234
      --snpFile ARG
                                the input snp file path
235
      --indFile ARG
                                the input ind file path
236
      --snpSet ARG
                                the snpSet of the package: 1240K, HumanOrigins or
237
                                Other. (only relevant for data input with
238
                                -p|--genoOne or --genoFile + --snpFile + --indFile,
239
                                because the packages in a -d|--baseDir already have
                                this information in their respective POSEIDON.yml
241
                                files) Default: Other
242
                                A file with a list of packages, groups or individual
243
      --forgeFile ARG
                                samples. Works just as -f, but multiple values can
244
                                also be separated by newline, not just by comma.
245
                                Empty lines are ignored and comments start with "#",
246
                                so everything after "#" is ignored in one line.
247
```

Multiple instances of -f and --forgeFile can be 248 given. They will be evaluated according to their 249 input order on the command line. 250 List of packages, groups or individual samples to be -f,--forgeString ARG 251 combined in the output package. Packages follow the 252 syntax *package_title*, populations/groups are simply 253 group_id and individuals <individual_id>. You can 254 combine multiple values with comma, so for example: 255 "*package_1*, <individual_1>, <individual_2>, 256 group_1". Duplicates are treated as one entry. 257 Negative selection is possible by prepending "-" to 258 the entity you want to exclude (e.g. "*package 1*, 259 -<individual_1>, -group_1"). forge will apply excludes and includes in order. If the first entity 261 is negative, then forge will assume you want to merge 262 all individuals in the packages found in the baseDirs (except the ones explicitly excluded) before the 264 exclude entities are applied. An empty forgeString 265 (and no --forgeFile) will therefore merge all available individuals. If there are individuals in 267 your input packages with equal individual id, but 268 different main group or source package, they can be specified with the special syntax 270 "<package:group:individual>". 271 To extract specific SNPs during this forge operation, --selectSnps ARG provide a Snp file. Can be either Eigenstrat (file 273 ending must be '.snp') or Plink (file ending must be 274 '.bim'). When this option is set, the output package 275 will have exactly the SNPs listed in this file. Any 276 SNP not listed in the file will be excluded. If 277 option '--intersect' is also set, only the SNPs 278 overlapping between the SNP file and the forged 279 packages are output. 280 --intersect Whether to output the intersection of the genotype 281 files to be forged. The default (if this option is 282 not set) is to output the union of all SNPs, with 283 genotypes defined as missing in those packages which 284 do not have a SNP that is present in another package. 285 With this option set, the forged dataset will 286 typically have fewer SNPs, but less missingness. 287 the format of the output genotype data: EIGENSTRAT or --outFormat ARG 288 PLINK. Default: PLINK 289 should only a minimal output package be created? --minimal 290 --onlyGeno should only the resulting genotype data be returned? 291

292

This means the output will not be a Poseidon package

```
-o, -- outPackagePath ARG
                                 the output package directory path
293
                                 the output package name - this is optional: If no
      -n, -- outPackageName ARG
294
                                 name is provided, then the package name defaults to
295
                                 the basename of the (mandatory) --outPackagePath
296
                                 argument
297
                                 Skip the selection step in forge. This will result in
      --no-extract
298
                                 outputting all individuals in the relevant packages,
299
                                  and hence a superset of the requested
300
                                  individuals/groups. It may result in better
301
                                 performance in cases where one wants to forge entire
302
                                 packages or almost entire packages. Note that this
303
                                 will also ignore any ordering in the output
304
                                 groups/individuals. With this option active,
                                  individuals from the relevant packages will just be
306
                                 written in the order that they appear in the original
307
                                 packages.
   forge can be used with
309
   trident forge -d ... -d ... \
      -f "*package_name*, group_id, <individual_id>" \
311
      -o path/to/new_package_name
312
   where the entities (packages, groups/populations, individuals/samples) you want in the output package can be
313
   denoted either as a string on the command line (-f/--forgeString), or in an input text file (--forgeFile).
314
   See the section below for the syntax of this selection language. Do not forget to wrap the --forgeString query
315
   in quotes.
316
   Including one or multiple Poseidon packages with -d is not the only way to include data for a forge operation.
317
   It is also possible to consider unpackaged genotype data directly with -p (+ --snpSet) or --inFormat +
318
    --genoFile + --snpFile + --indFile (+ --snpSet). This makes the following example possible, where we
319
   merge data from one Poseidon package and two genotype datasets to get a new EIGENSTRAT dataset.
320
   trident forge \
321
      -d 2017_GonzalesFortesCurrentBiology \
322
      -p 2018_VeeramahPNAS/2018_VeeramahPNAS.fam \
323
      --inFormat PLINK \
324
      --genoFile 2017_HaberAJHG/2017_HaberAJHG.bed \
325
      --snpFile 2017_HaberAJHG/2017_HaberAJHG.bim \
326
      --indFile 2017_HaberAJHG/2017_HaberAJHG.fam \
327
      -f "<STR241.SG>,<ERS1790729.SG>,Iberia_HG.SG" \
328
      -o testpackage \
329
      --outFormat EIGENSTRAT \
330
      --onlyGeno
331
```

332 **0.1.2.3.1** The forge selection language The text in --forgeString and --forgeFile are parsed as a
333 domain specific query language that describes precisely which entities should be compiled in the output package
334 of a given forge operation. The language has multiple syntactic elements and a specific evaluation logic.

In general a --forgeString query consists of multiple entities, separated by ,. The main entities are Poseidon packages, groups/populations and individuals/samples:

- Each package title is surrounded by *: *package*. That means if you want all individuals of the Poseidon
 package 2019_Jeong_InnerEurasia in the output package you would add *2019_Jeong_InnerEurasia*
 to the query.
- Groups/populations are not specially marked: group. So to get all individuals of the group Swiss_Roman_period, you would simply add Swiss_Roman_period.
- Individuals/samples are surrounded by < and >: <individual>. ALAO26 therefore becomes <ALAO26>. A second way to denote individuals is with the more verbose and specific syntax <package:group:individual>. Such defined individuals take precedence over differently defined ones (so: directly with <individual> or as a subset of *package* or group). This allows to resolve duplication issues precisely at least in cases where the duplicated individuals differ in source package or primary group.

In the --forgeFile each line is treated as a separate forgeString, empty lines are ignored and #s start comments.

So this is a valid forgeFile:

```
# Packages
349
   *package1*, *package2*
350
351
   # Groups and individuals from other packages beyond package1 and package2
352
   group1, <individual1>, group2, <individual2>, <individual3>
353
354
   # group2 has two outlier individuals that should be ignored
355
   -<bad_individual1> # This one has very low coverage
356
   -<bad_individual2> # This one is from a different time period
357
```

By prepending - to the bad individuals, we can exclude them from the forged package. forge figures out the final list of samples to include by executing all forge-entities in order. So an entity list

PackageA,-<Individual1>,GroupA may result in a different outcome than *PackageA*,GroupA,-<Individual1>,
depending on whether <Individual1> belongs to GroupA or not. If the forge entity list starts with a negative
entity, or if the entity list is empty, forge will implicitly assume you want to include all individuals in all
packages found in the baseDirs (except the ones explicitly excluded, of course).

An empty forgeString will therefore merge all available individuals.

371

372

373

374

O.1.2.3.2 Treatment of the .janno file while merging forge merges and subsets .janno files along with the genotype data. If a package lacks a .janno file, then a basic one will be created internally based on the information in the genotype data, and used for the output. Missing columns across packages will be filled with n/a.

For merging two janno files **A** and **B** the following rules apply regarding undefined, arbitrary additional columns:

- If A has an additional column which is not in B then empty cells in the rows imported from B are filled with n/a.
- If **A** and **B** share additional columns with identical column name, then they are treated as semantically identical units and merged accordingly.
- In the resulting .janno file, all additional columns from both **A** and **B** are sorted alphabetically and appended after the normal, specified variables.

376 The following example illustrates the described behaviour:

377 A.janno

Poseidon_ID	Group_Name	Genetic_Sex	AdditionalColumn1	AdditionalColumn2
XXX011	POP1	M	A	D
XXX012	POP2	F	В	E
XXX013	POP1	M	C	\mathbf{F}

378 B.janno

Poseidon_ID	Group_Name	Genetic_Sex	AdditionalColumn3	AdditionalColumn2
YYY022	POP5	F	G	J
YYY023	POP5	F	Н	K
YYY024	POP5	M	I	L

379 A.janno + B.janno

Poseidon_ID	Group_Name	e Genetic_Sex	AdditionalColumn1	${\bf Additional Column 2}$	AdditionalColumn3
XXX011	POP1	\mathbf{M}	A	D	n/a
XXX012	POP2	F	В	E	n/a
XXX013	POP1	M	\mathbf{C}	F	n/a
YYY022	POP5	F	n/a	J	G
YYY023	POP5	F	n/a	K	H
YYY024	POP5	M	n/a	L	I

O.1.2.3.3 Other options Just as for init the output package of forge is created as a new directory -o.
The title can also be explicitly defined with -n.

--minimal allows for the creation of a minimal output package without .bib and .janno. This is especially useful for data analysis pipelines, where only the genotype data is required. Even more basic output comes with --onlyGeno, which means that only the genotype data is returned without any Poseidon package.

forge has a an optional flag --intersect, that defines, if the genotype data from different packages should be merged with an **union** or an **intersect** operation. The default (if this option is not set) is to output the union of all SNPs, with genotypes defined as missing in samples from packages which do not have a SNP that is present in another package. With this option set, on the other hand, the forged dataset will typically have fewer SNPs, but less missingness.

--intersect also influences the automatic determination of the snpSet field in the POSEIDON.yml file for the resulting package. If the snpSets of all input packages are identical, then the resulting package will just inherit this configuration. Otherwise forge applies the following pairwise merging logic:

Input snpSet A	Input snpSet B	intersect	Ouput snpSet
Other	*	*	Other

Input snpSet A	Input snpSet B	intersect	Ouput snpSet
1240K	HumanOrigins	True	HumanOrigins
1240K	HumanOrigins	False	$1240 \mathrm{K}$

```
--selectSnps allows to provide forge with a SNP file in EIGENSTRAT (.snp) or PLINK (.bim) format to create a package with a specific selection. When this option is set, the output package will have exactly the SNPs listed in this file. Any SNP not listed in the file will be excluded. If --intersect is also set, only the SNPs overlapping between the SNP file and the forged packages are output.
```

Merging genotype data across different data sources and file formats is tricky. forge is more verbose about potential issues, if the --logMode flag is set to VerboseLog.

The --onlyGeno command specifies that only genotype data should be output, not an entire Poseidon package.

400 **0.1.2.4 Genoconvert command** genoconvert converts the genotype data in a Poseidon package to a different file format. The respective entries in the POSEIDON.yml file are changed accordingly.

402 Click here for command line details

429

430

--outFormat ARG

Usage: trident genoconvert ((-d|--baseDir DIR) |

```
((-p|--genoOne ARG) | --inFormat ARG --genoFile ARG
404
                                    --snpFile ARG --indFile ARG) [--snpSet ARG])
405
                                --outFormat ARG [--onlyGeno]
                                [-o|--outPackagePath ARG] [--removeOld]
407
     Convert the genotype data in a Poseidon package to a different file format
408
   Available options:
410
     -h,--help
                                Show this help text
411
     -d,--baseDir DIR
                                a base directory to search for Poseidon Packages
412
                                (could be a Poseidon repository)
413
     -p,--genoOne ARG
                                one of the input genotype data files. Expects .bed or
414
                                .bim or .fam for PLINK and .geno or .snp or .ind for
415
                                EIGENSTRAT. The other files must be in the same
416
                                directory and must have the same base name
417
     --inFormat ARG
                                the format of the input genotype data: EIGENSTRAT or
418
                                PLINK (only necessary for data input with --genoFile
419
                                + --snpFile + --indFile)
420
                                the input geno file path
     --genoFile ARG
421
     --snpFile ARG
                                the input snp file path
422
     --indFile ARG
                                the input ind file path
423
     --snpSet ARG
                                the snpSet of the package: 1240K, HumanOrigins or
424
                                Other. (only relevant for data input with
425
                                -p|--genoOne or --genoFile + --snpFile + --indFile,
426
                                because the packages in a -d|--baseDir already have
427
```

files) Default: Other

this information in their respective POSEIDON.yml

the format of the output genotype data: EIGENSTRAT or

```
PLINK.
431
                                 should only the resulting genotype data be returned?
      --onlyGeno
432
                                 This means the output will not be a Poseidon package
433
                                 the output package directory path - this is optional:
      -o, -- outPackagePath ARG
434
                                  If no path is provided, then the output is written to
435
                                 the directories where the input genotype data file
436
                                  (.bed/.geno) is stored
437
      --removeOld
                                 Remove the old genotype files when creating the new
438
                                  ones
430
   With the default setting
440
   trident genoconvert -d ... -d ... --outFormat EIGENSTRAT|PLINK
441
   all packages in -d will be converted to the desired --outFormat (either EIGENSTRAT or PLINK), if the data is
   not already in this format. This includes updating the respective POSEIDON.yml files.
443
   The "old" data is not deleted, but kept around. That means conversion can result in a package with both PLINK
   and EIGENSTRAT data, but only one is linked in the POSEIDON yml file, and that is what will be used by
445
   trident. To delete the old data in the conversion you can add the --removeOld flag.
446
   Instead of -d to change Poseidon packages, the -p (+ --snpSet) or --inFormat + --genoFile + --snpFile
   + --indFile (+ --snpSet) allow to directly convert genotype data that is not wrapped in a Poseidon package
448
   and store it to a directory given in -o. See this example:
449
   trident genoconvert \
450
      -p 2018_Mittnik_Baltic/Mittnik_Baltic.bed \
451
      --outFormat EIGENSTRAT
452
      -o my_directory
453
            Update command update automatically harmonizes POSEIDON.yml files of one or multiple
454
   packages if the packages were changed. This is not an automatic update from one Poseidon version to the next!
455
   Click here for command line details
456
   Usage: trident update (-d|--baseDir DIR) [--poseidonVersion ARG]
457
                            [--ignorePoseidonVersion] [--versionComponent ARG]
                            [--noChecksumUpdate] [--newContributors ARG]
459
                            [--logText ARG] [--force]
460
     Update POSEIDON.yml files automatically
   Available options:
463
      -h,--help
                                 Show this help text
      -d,--baseDir DIR
                                 a base directory to search for Poseidon Packages
465
                                  (could be a Poseidon repository)
466
      --poseidonVersion ARG
                                 Poseidon version the packages should be updated to:
467
                                  e.g. "2.5.3" (default: Nothing)
      --ignorePoseidonVersion
                                 Read packages even if their poseidonVersion is not
469
                                  compatible with the trident version. The assumption
470
                                  is, that the package is already structurally adjusted
471
```

```
to the trident version and only the version number is
472
                                lagging behind.
473
                                Part of the package version number in the
      --versionComponent ARG
474
                                POSEIDON.yml file that should be updated: Major,
475
                                Minor or Patch (see https://semver.org)
476
                                 (default: Patch)
477
      --noChecksumUpdate
                                Should update of checksums in the POSEIDON.yml file
478
                                be skipped
479
      --ignoreGeno
                                 ignore SNP and GenoFile
480
      --newContributors ARG
                                Contributors to add to the POSEIDON.yml file in the
481
                                form "[Firstname Lastname](Email address);..."
482
      --logText ARG
                                Log text for this version jump in the CHANGELOG file
483
                                 (default: "not specified")
      --force
                                Normally the POSEIDON.yml files are only changed if
485
                                the poseidonVersion is adjusted or any of the
                                 checksums change. With --force a package version
                                update can be triggered even if this is not the case.
488
   It can be called with a lot of optional arguments
   trident update -d ... -d ... \
490
      --poseidonVersion "X.X.X" \
491
      --versionComponent Major/Minor/Patch \
     --noChecksumUpdate
493
      --ignoreGeno
494
      --newContributors "[Firstname Lastname](Email address);..."
      --logText "short description of the update"
496
      --force
497
```

By default update will not edit a package's POSEIDON.yml file, even when arguments like --versionComponent,
--newContributors or --logText are explicitly set. This default exists to run the function on a large set of
packages where only few of them were edited and need an active update. A package will only be modified by
update if either

- any of the files with checksums (e.g. the genotype data) in it were modified,
- the --poseidonVersion argument differs from the poseidonVersion in the package's POSEIDON.yml file
- or the --force flag was set in update.

502

503

505

508

510

511

512

513

514

If any of these applies to a package in the search directory (--baseDir/-d), it will be updated. This includes the following steps:

- If --poseidonVersion is different from the poseidonVersion field in the package, then that will be updated.
- The packageVersion will be incremented. If --versionComponent is not set, then it falls back to Patch, so a change in the last position of the three digit version number. Minor increments the middle, and Major the first position (see semantic versioning).
- The lastModified field will be updated to the current day (based on your computer's system time).
- The contributors in --newContributors will be added to the contributor field if they're not there already.

- If any checksums changed, then they will be updated. If certain checksums are not set yet, then they will be added. The checksum update can be skipped with --noChecksumUpdate or partially skipped for the genotype data with --ignoreGeno.
- The CHANGELOG.md file will be updated with a new row for the new version and the text in --logText (default: "not specified"), which will be appended as the first line of the file. If no CHANGELOG.md file exists, then it will be created and referenced in the POSEIDON.yml file.

522 :heavy_exclamation_mark: As update reads and rewrites POSEIDON.yml files, it may change their inner order, 522 layout or even content (e.g. if they have fields which are not in the Poseidon package definition). Create a backup 523 of the POSEIDON.yml file before running update if you are uncertain.

0.1.3 Inspection commands

515

516

517

518

519

520

524

554

525 **0.1.3.1 List command** list lists packages, groups and individuals of the datasets you use, or of the packages available on the server.

527 Click here for command line details

trident list -d ... -d ... --packages

This will yield a table like this

```
Usage: trident list ((-d|--baseDir DIR) | --remote [--remoteURL ARG])
                         (--packages | --groups | --individuals
529
                           [-j|--jannoColumn JANNO HEADER]) [--raw]
530
     List packages, groups or individuals from local or remote Poseidon
531
      repositories
532
533
   Available options:
534
      -h,--help
                                 Show this help text
535
      -d,--baseDir DIR
                                 a base directory to search for Poseidon Packages
536
                                 (could be a Poseidon repository)
      --remote
                                 list packages from a remote server instead the local
538
                                 file system
539
      --remoteURL ARG
                                 URL of the remote Poseidon server
540
                                 (default: "https://c107-224.cloud.gwdg.de")
541
      --packages
                                 list all packages
542
      --groups
                                 list all groups, ignoring any group names after the
543
                                 first as specified in the Janno-file
544
      --individuals
                                 list individuals
545
      -j,--jannoColumn JANNO_HEADER
546
                                 list additional fields from the janno files, using
547
                                 the Janno column heading name, such as Country, Site,
548
                                Date_C14_Uncal_BP, Endogenous, ...
      --raw
                                 output table as tsv without header. Useful for piping
550
                                 into grep or awk
551
                                 ignore SNP and GenoFile
      --ignoreGeno
552
   To list packages from your local repositories, as seen above you can run
553
```

```
| Nr Individuals |
                        Title
                                                       Date

                                                 | 2020-08-10 | 2772
561
                                                  1 ...
                                                                1
562
563
   so a nicely formatted table of all packages, their last update and the number of individuals in it.
   To view packages on the remote server, instead of using directories to specify the locations of repositories on
565
   your system, you can use --remote to show packages on the remote server. For example
566
   trident list --packages --remote
   will result in a view of all published packages in our public online repository.
568
   You can also list groups, as defined in the third column of EIGENSTRAT .ind files (or the first column of a
   PLINK .fam file), and individuals with --groups and --individuals instead of --packages.
570
   The --individuals flag provides a way to immediately access information from the .janno files on the
571
   command line. This works with the -j/--jannoColumn option. For example adding --jannoColum Country
572
    --jannoColumn Date_C14_Uncal_BP to the commands above will add the Country and the Date_C14_Uncal_BP
573
   columns to the respective output tables.
574
   Note that if you want a less fancy table, for example because you want to load this into Excel, or pipe into
575
   another command that cannot deal with the neat table layout, you can use the --raw option to output that
576
   table as a simple tab-delimited stream.
             Summarise command summarise prints some general summary statistics for a given poseidon
578
   dataset taken from the .janno files.
579
   Click here for command line details
   Usage: trident summarise (-d|--baseDir DIR) [--raw]
581
```

Get an overview over the content of one or multiple Poseidon packages

584 Available options:

582

585

587

-h,--help Show this help text

-d,--baseDir DIR a base directory to search for Poseidon Packages

(could be a Poseidon repository)

output table as tsv without header. Useful for piping

into grep or awk

You can run it with

trident summarise -d ... -d ...

which will show you context information like – among others – the number of individuals in the dataset, their sex distribution, the mean age of the samples (for ancient data) or the mean coverage on the 1240K SNP array in a table. summarise depends on complete .janno files and will silently ignore missing information for some statistics.

- You can use the --raw option to output the summary table in a simple, tab-delimited layout.
- 597 0.1.3.3 Survey command survey tries to indicate package completeness (mostly focused on .janno files)

598 for poseidon datasets.

- 599 Click here for command line details
- 600 Usage: trident survey (-d|--baseDir DIR) [--raw]

Survey the degree of context information completeness for Poseidon packages

603 Available options:

504 -h,--help Show this help text

os -d,--baseDir DIR a base directory to search for Poseidon Packages

(could be a Poseidon repository)

607 --raw output table as tsv without header. Useful for piping

into grep or awk

609 Running

602

- 610 trident survey -d ... -d ...
- $_{611}$ will yield a table with one row for each package. See trident survey -h for a legend which cell of this table

612 means what.

- Again you can use the --raw option to output the survey table in a tab-delimited format.
- 614 0.1.3.4 Validate command validate checks poseidon datasets for structural correctness.
- 615 Click here for command line details
- 616 Usage: trident validate (-d|--baseDir DIR)
- 617 Check one or multiple Poseidon packages for structural correctness
- 619 Available options:

618

630

633

- 620 -h,--help Show this help text
- 621 -d,--baseDir DIR a base directory to search for Poseidon Packages
- (could be a Poseidon repository)
- 623 --ignoreGeno ignore SNP and GenoFile
- 624 --noExitCode do not produce an explicit exit code
- 625 --ignoreDuplicates do not stop on duplicated individual names in the
- package collection
- You can run it with
- 628 trident validate -d ... -d ...
- and it will either report a success (Validation passed) or failure with specific error messages to simplify fixing
- validate tries to ensure that each package in the dataset adheres to the schema definition. Here is a list of what is checked:
 - Presence of the necessary files

• Full structural correctness of .bib and .janno file

635

636

637

- Superficial correctness of genotype data files. A full check would be too computationally expensive
- Correspondence of BibTeX keys in .bib and .janno
- Correspondence of individual and group IDs in .janno and genotype data files
- In fact much of this validation already runs as part of the general package reading pipeline invoked for many trident subcommands (e.g. forge). validate is meant to be more thorough, though, and will explicitly fail if even a single package is broken.
- Remember to run it with --logMode VerboseLog to get more information if the output is not sufficient to debug
 an issue.
